WII. Aspects of Well-Being

Here we describe the process of compiling our initial master list of 136 “aspect of well-being” survey measures; the measures are listed below, together with references to the literature. We then describe how we created two additional list versions from the first 108 aspect measures.

Subsection (a) lists the six broad classes from which our 136 aspects were generated; subsection (b) lists the considerations that affected how we phrased the aspects; subsection (c) provides a legend to the abbreviated references that accompany the aspect list; and subsection (d) provides the master list itself.

Subsection (e) then explains how we divided our master list of 136 aspects into 108 *you-*, 5 *you-only-*, and 23 *public-*aspects, and how we modified the *you-*aspects (the first 108 aspects on the master list) to create 108 *everyone-*aspects that apply to everyone in the nation and 108 *others-*aspects that apply to others in the nation (as explained in the main text, *others-*aspects appear in scenarios that are not analyzed in the paper). Finally, these latter two modified lists are reported in subsections (f) and (g), respectively.

(a) Classes of Measures of Aspects of Well-Being

There are six classes of survey measures that we include:

- 1. *Single-question survey measures of SWB.*** Since most of the evidence in the happiness literature to date is based on single-question SWB measures, it is important that our list, which explicitly looks beyond traditional SWB measures, also include an extensive set of versions of such traditional measures. We hence include measures modeled after the SWB questions most commonly used in large-scale social surveys. These include, for example, those asked in or proposed for the U.K. survey discussed in the Introduction.¹ We include both cognitive, evaluative SWB measures (e.g., life satisfaction) and affective, hedonic ones (including an array of positive and negative emotions).
- 2. *Multi-question survey measures of SWB.*** While empirical work in economics relies heavily on single-question survey measures, much research in psychology uses multi-question scales, such as the PANAS (Positive And Negative Affect Scale) and the GHQ (General Health Questionnaire, a measure of mental health). In addition to measures modeled after questions comprising these scales, we also included measures based on questions comprising the Scale of Positive and Negative Experience (SPANE), the Affect Balance Scale (ABS), and the Health and Retirement Study’s Psychosocial Leave-Behind.
- 3. *Aspects of well-being proposed by prominent economists, psychologists, and philosophers.*** This class comprises by far the largest subset of our list. To the best of our knowledge, our effort reflects the most systematic attempt to date to gather aspects from prominent works—all of which explicitly compose lists of

¹ Hence, we draw from documents that propose questions for the U.K. survey beyond the four questions that were ultimately selected. These are Dolan, Layard, and Metcalfe’s (2011) Office for National Statistics (ONS) publication and Deaton, Kahneman, Krueger, Schkade, Schwarz, and Stone’s (2011) memo to the ONS’s Advisory Group on Subjective Well-Being.

specific factors that are proposed to be important determinants of well-being—and compile them all into one list. While the past work we consulted is but a sample of a much broader body of research, we hope it is a sample chosen carefully enough to make the resulting list relatively comprehensive.

We started with the list proposed by the Stiglitz Commission (officially, “the Commission on the Measurement of Economic Performance and Social Progress”). The French government convened the commission at the beginning of 2008 with official aims that included “to identify the limits of GDP as an indicator of economic performance and social progress” and “to consider additional information required for the production of a more relevant picture.” The commission’s final report (Stiglitz, Sen, and Fitoussi, 2009) emphasizes the view that “well-being is multi-dimensional” and details what its members—among whom are prominent well-being researchers, mostly from economics but also from other disciplines such as psychology and political science—view as well-being’s most important dimensions.² We compiled an initial list that included the dimensions suggested in the report, and then broke them down into sub-dimensions specific enough that we could fit them into our survey as “aspect of well-being” questions. In this zooming-in process we consulted specific works by members of the commission (e.g., Kahneman and Deaton, 2010) to verify that our aspects use language that is as close as possible to the language used in past survey research.

Another candidate set of factors that matter for well-being, also an input into the commission’s composition and conclusions, was Sen’s (1985) and Nussbaum’s (2000) lists of “functionings” and “capabilities,” which we used to expand our list of aspects, and to create new aspects if they were not previously on our list.

A third candidate was Maslow’s (1946) theory of human motivation, which includes the famous pyramid of needs and a list of what he views as motivating “desires.”

We also consulted recent work in the psychology literature that attempts to look beyond happiness when breaking down the notion of psychological well-being into more basic components (e.g., Ryff, 1989). We paid special attention to Seligman’s enumeration of what constitutes well-being (“authentic happiness”). We especially focused on Seligman’s work that is aimed at informing policy (e.g., Diener and Seligman, 2004). We also checked that our resulting list did not miss aspects proposed by other recent enumerations of factors by confirming, for example, that it covered the main factors in Loewenstein and Ubel’s (2008) public policy recommendations.

Finally, to verify that our list covers the recent academic literature relatively comprehensively, we trained eleven research assistants (RAs) to carefully read through papers and books, highlighting passages that explicitly or implicitly identified key aspects of well-being and recording those aspects of well-being in a

² For example, the commission’s report states (Stiglitz et al., 2009, pp. 14-15):

“To define what well-being means, a multidimensional definition has to be used. Based on academic research and a number of concrete initiatives developed around the world, the Commission has identified the following key dimensions that should be taken into account. At least in principle, these dimensions should be considered simultaneously:

i. Material living standards (income, consumption and wealth); ii. Health; iii. Education; iv. Personal activities including work[;] v. Political voice and governance; vi. Social connections and relationships; vii. Environment (present and future conditions); viii. Insecurity, of an economic as well as a physical nature.

All these dimensions shape people’s well-being, and yet many of them are missed by conventional income measures.”

spreadsheet. Initially, we instructed two RAs about how to do this. The instruction process included several meetings in which we went over a few papers together; demonstrated to the RAs what we wanted them to do; then gave them a few days to do it themselves; and then met again to go over what they did, answer questions, and provide feedback. The RA training process consisted, first, of 3 initial training hours of the two RAs by the authors of this paper. Second, these two RAs wrote a training document (available upon request) that very briefly summarizes what they did, and which they used in training the nine additional RAs. Third, the authors then met twice with the entire set of eleven RAs to go over examples of work that had been done in the early weeks of the project and answer questions.

Overall, over the course of June-September, 2011, the eleven RAs covered 34 articles and 4 books, which are listed, along with the other works we drew on, in subsection (c) below. We started with an initial set of papers and books that we were aware of (e.g., Alkire, 2002) as well as work referenced in the initial set, work referenced in the referenced work, etc. The resulting RAs' spreadsheet of proposed aspects and highlighted articles are available as Supplementary Materials to this paper. From this spreadsheet, we culled many additional aspects.

Finally, we trained two new RAs to read through John Rawls's *Theory of Justice*, a major work we had omitted earlier (and subsequently read). While we did not add new aspects on the basis of this book, we verified that we had not missed important ones.

4. *Our own introspection and discussion.* We further extended and refined the list both by drawing on our own previous research (Benjamin, Heffetz, Kimball, and Rees-Jones, 2012), which aimed to empirically identify aspects in addition to own happiness that help predict survey respondents' hypothetical choices; and by drawing on our own introspection regarding the factors that enter preferences, inspired in part by our reading of non-academic writers and by extensive conversations among ourselves and with colleagues.

In many cases, seemingly-similar but differently-worded aspects coming from these four classes were both candidates for inclusion in the list. To determine whether two candidate aspects, A and B, were distinct, we attempted to formulate examples where a person might want something that is an example of B but which cannot be considered an example of A (or at least in the spirit of A), and vice versa, switching A and B. If we could formulate such examples, we considered A and B to be distinct.

In other cases, we judged that valuable things proposed by researchers (from class 3 above) were not "fundamental." We then attempted to come up with the fundamental aspects that explain *why* someone would want that thing. For example, it is often claimed that religion contributes to happiness and well-being. We refined "religion" into several aspects of well-being that may help explain the value of religion but which are also valued by many non-religious people, such as aspects 91–96 and 101–108, including "you having people around you who share your values, beliefs and interests," "your opportunities to participate in ceremonies, cultural events, and celebrations that are meaningful to you" and "your sense of connection with the universe or the power behind the universe."

5. *New combination aspects that might be "summary measures" of well-being.* In addition to trying to compile a list of fundamental things that many people want, we also sought to come up with a single measure that, all by itself, would be as highly correlated as possible with stated preference. We conceptualize such a "summary measure" not as a fundamentally-valued aspect of well-being (i.e., not as an element of the w vector in the

theory), but rather as a particular survey question that might cause respondents, when responding to it, to take into account the great variety of aspects they consider when making choices. In terms of the theory, we think of a summary measure as eliciting an especially broad combination aspect, i.e., the answer to a single question that yields a function of many of the elements of w and that might have an especially high correlation with choice. We consider some of the existing SWB measures, such as “how happy you feel during your life,” “how satisfied you are with your life,” and “how close your life is to being ideal” to be candidate summary measures. We also formulated summary measures that, as far as we know, have not been used previously in surveys, e.g., “how much you like your life” and “the overall well-being of you and your family.” Since we took the view that our ability to predict *a priori* which measure would have the highest correlation with choice is severely limited, this class accounts for a large number of questions.

6. Subjective versions of “objective” measures of well-being. We additionally sought to include a few “objective” measures that—while not considered by us or others to be fundamentally-valued aspects of life—are often used by economists and policymakers as proxies for well-being. For this purpose, we included questions about total GDP, GDP per capita, GDP growth, the unemployment rate, the inflation rate, income equality, longevity, and health. Of course, our survey questions refer to *subjective perceptions* of these quantities, rather than their objective levels. Nonetheless, by including them, we can assess how people weight these objective measures compared with the subjective measures we include.

At the boundary of this class are subjective evaluations of an individual’s constraints and feasible choice set, such as “feeling that you have enough time and money for the things that are most important to you” and “having many options and possibilities in your life and the freedom to choose among them.” We felt that such measures might point to fundamental desirable perceptions—i.e., perceptions that people would like to have regardless of whether they take advantage of the perceived choices and even regardless of whether they objectively have these choices—as well as indicate how much of other aspects seem obtainable. (The aspect “having many options and possibilities...” also belongs to class 3 above, as it has been proposed by Sen, Nussbaum, and others.)

A primary criterion for *not* including an aspect on our list, even if we felt it was fundamental, was if experiencing that aspect would require either supernatural power or technology that is currently unavailable. For example, we excluded “your freedom from death” even though it seems to be a fundamentally-desired thing and, arguably, a motivating factor in some people’s behavior. Similarly, we excluded all afterlife aspects.

(b) Aspects of Well-Being: Phrasing

We had a number of considerations when deciding how to phrase an aspect. We tried to:

- *Phrase in the context of specific choices.* Doing so enables us to compare aspects with each other as consequences of, as affected by, and as motivating choices (i.e., as relevant arguments in the utility function).

- *Phrase in a way that allows for a limited-time-frame interpretation.* Doing so enables us to elicit the “single period” effects of stated choices, thereby alleviating concerns that would result, e.g., from cross-respondent differences in time integration. Thus, for example, we avoided phrases such as “during your lifetime.”
- *Orient so that rating higher would conventionally be considered desirable.* Doing so likely reduces respondent confusion and thereby reduces errors and shortens survey time. For example, instead of asking about “how anxious you feel,” we ask about “you not feeling anxious.”
- *Write in language that would be understandable by most survey respondents in a national sample.* In some cases, we put several different phrases in the same question that were not synonymous, but which we thought were closely enough associated that they would clarify each other’s meaning and clarify the spirit of what we were asking.
- *For aspects 1–108: phrase in a way that minimizes changes to text when switching between “you,” “others,” and “people.”* Doing so allows us to easily incorporate other-regarding preferences, for example, to replace “how happy you feel” with “how happy others feel” or with “how happy people feel.” (See subsection (e) below.)
- *For closely-related aspects: combine into a single question.* While ideally we would include each distinct aspect as a separate survey question, we felt that combining closely-related aspects was a reasonable compromise that allowed us to cover more ground in our constrained amount of survey time.
- *For existing survey questions: word as closely as possible to the original question.* Doing so makes the analysis of our question as informative as possible regarding the existing question.

In some cases we were forced to trade off between these goals. For example, we phrased the aspect modeled after the U.K. survey question “Overall, how anxious did you feel yesterday?” as “you not feeling anxious.”

(c) Aspects of Well-Being Origin: Legend

To facilitate tracking the origin of each aspect on our list, we indicate relevant references in the parentheses next to each aspect. In some cases—e.g., “your freedom from pain,” “your material standard of living,” or “you being a good, moral person and living according to your personal values”—where the importance of the aspect is highlighted by virtually an entire body of literature, the references we list are merely examples.

Corresponding to aspect classes 1–6 (see (a) above), we use the following abbreviations:

Aspect Class 1.

SWB We use this abbreviation to indicate aspects modeled after SWB measures used in large-scale surveys, including: the Euro-Barometer Survey; the European Social Survey; the German Socioeconomic Panel; the Japanese Life in Nation survey; the U.S.-based Gallup-Healthways Well-Being Index, General Social Survey, Health and Retirement Study, National Survey of Families and Households, and Survey of Consumers; and the World Values Survey.

Aspect Classes 2., 3., and 4.

We use the following abbreviations:

HRS This includes aspects that are inspired by the Psychosocial Leave-Behind from the Health and Retirement Study. These are distinct from usual SWB measures, since they tend to be more detailed than questions typically included on other large-scale surveys.

Aspect Class 4.

Int Our own introspection.

Aspect Class 5.

Sum New combination-aspect "summary measures."

Aspect Class 6.

Obj Subjective measures of "objective" indicators.

(d) Our Master List of 136 Aspects:

1. how satisfied **you** are with your life (SWB, DS)
2. **your** rating of your life on a ladder where the lowest rung is "worst possible life for you" and the highest rung is "best possible life for you" (SWB, KD, DKS)
3. how close **your** life is to being ideal (MS, DE)
4. the overall well-being of **you** and your family (Sum, BHKS)
5. **you** feeling that things are going well for you (MS, DE)
6. **you** getting the things you want out of life (ABS, DE, SN)
7. the extent to which **you** feel the things you do in your life are worthwhile (DLM)
8. how fulfilling **your** life is (SN, SLW, KN, DE)
9. how rewarding the activities in **your** life are (WD, DLM)
10. **you** having a beautiful life story, or a life that is "like a work of art" (RS)
11. how full of beautiful memories **your** life is (Int, BHKS)
12. how grateful **you** feel for the things in your life (DE, SM)
13. how much **you** appreciate your life (SM, TJ)
14. the absence of regret **you** feel about your life (SM, HRS)
15. how desirable **your** life is (KR)
16. how glad **you** are to have the life you have rather than a different life (KN, ABS)
17. the extent to which **you** "have a good life" (SN, KN)
18. how much **you** like your life (Sum, BHKS)
19. **you** feeling that you have been fortunate in your life (Sum, BHKS)
20. **your** sense of optimism about your future (SM, DE-Flourishing)

21. **you** having many options and possibilities in your life and the freedom to choose among them (SN, DS, RW)
22. **your** sense that things are getting better and better (DBD)
23. how happy **you** feel (SWB, DS)
24. how much of the time **you** feel happy (SWB, DS, KD, DE)
25. how often **you** smile or laugh (G, SM, DS, KD, SWB)
26. how much **you** enjoy your life (DBD, AHC, Q, DS, KD, SWB)
27. the absence of sadness in **your** life (DE-SPANE, DS, KD, DKS)
28. **you** not feeling depressed (GHQ, ABS, R)
29. the absence of anger in **your** life (DKS, DE-SPANE, KD)
30. the absence of frustration in **your** life (WD, DS)
31. the absence of fear in **your** life (SN, PANAS, DE-SPANE, DS)
32. **you** not feeling anxious (DLM, WD)
33. the absence of stress in **your** life (DKS, GHQ, DLM, DE, KD, DS)
34. the absence of worry in **your** life (DLM, GHQ, KD, DKS)
35. the quality of **your** sleep (DKS)
36. **your** physical safety and security (GBF, CR, G, Q, DG, M2, SN, SSF)
37. the amount of order and stability in **your** life (Int, BHKS)
38. **your** sense of security about life and the future in general (Int, BHKS)
39. **your** physical comfort (M1)
40. **your** freedom from pain (DG, BHKR, SN, DKS)
41. how easy and free of annoyances **your** life is (HRS)
42. how peaceful, calm, and harmonious **your** life is (TJ, GBF)
43. how often **you** can feel relaxed instead of feeling your life is hectic (DLM, WD, WSC)
44. **you** feeling that you have enough time and money for the things that are most important to you (BHKS)
45. **your** financial security (DBD, DLM, G, DG)
46. **your** material standard of living (DE, WSC, SSF)
47. **your** ability to dream and pursue your dreams (LU)
48. **your** ability to use your imagination and be creative (SN, AHC, KN, RW)
49. **you** having many moments in your life when you feel inspired (SM, PANAS)
50. how much beauty **you** experience in your life (WA, SM, RW)
51. the amount of pleasure in **your** life (WD, BBM, DE, DS)
52. the amount of fun and play in **your** life (SN, BHKR, GBF)
53. **you** having new things, adventure, and excitement in your life (ST)
54. **your** sense of discovery and wonder (SM, M(desire))
55. **you** feeling that you understand the world and the things going on around you (DG, BMP, M(desire))
56. **your** knowledge, skills, and access to information (GBF, SM, SN, SSF, RW)
57. how often **you** are able to challenge your mind in a productive or enjoyable way (WA, DE)
58. how interesting, fascinating, and free of boredom **your** life is (DE, ABS, PANAS, BHKR, DS)
59. **your** ability to be yourself and express yourself (WA, BMP, LU, M5)
60. **your** personal growth (R, BMP)

61. **you** “being the person you want to be” (SN, BHKS)
62. **your** ability to fulfill your potential (TJ, WSC, R, M5)
63. **your** sense of purpose (R, DE-Flourishing, KN, TJ, BHKR, DS)
64. **you** feeling that your life has direction (RS, AHC, RW)
65. **your** sense of control over your life (SN, G, BHKR, R)
66. **your** sense that your life is meaningful and has value (G, LU,R, SM, KN, GBF, TJ, DE-Flourishing, DS, M(desire))
67. **your** sense that you are making a difference, actively contributing to the well-being of other people, and making the world a better place (DS, DE-Flourishing, BBM, LU, DLM)
68. the overall quality of **your** experience at work (DS, KSS, DG, DE, SM, DLM, SN, SSF)
69. how often **you** become deeply engaged in your daily activities (so deeply engaged that you lose track of time) (DE-Flourishing, DS, WSC)
70. **your** feeling of independence and self-sufficiency (SN, R, DCG, M4, MS)
71. **your** sense that you are competent and capable in the activities that matter to you (DE-Flourishing, WA)
72. **your** ability to shape and influence the things around you (DCG, R)
73. **your** sense of achievement and excellence (MS, SN, KN, RS, DS)
74. **your** enjoyment of winning, competing, and facing challenges (WA)
75. **your** success at accomplishing your goals (SLW, DE, DS)
76. **your** chance to live a long life (SN, AHC, SSF)
77. **your** health (SM, G, RS, Q, DS, SN, SSF, RW)
78. **your** mental health and emotional stability (DG, SN, AHC, GHQ, DS, DLM, TJ)
79. **your** absence of internal conflict (conflict within yourself) (RS, BMP)
80. **your** ability to fully experience the entire range of healthy human emotions (LU, SN)
81. **you** feeling alive and full of energy (DLM, WA, DG, PANAS, RW)
82. **your** passion and enthusiasm about things in your life (PANAS, SM)
83. **your** pride and respect for yourself (PANAS, ABS, SN, DE, RW)
84. **you** having the people around you think well of you and treat you with dignity and respect (AHC, SN, M4, DE-Flourishing, RW)
85. **you** having a role to play in society (TJ, AHC, DG, DBD, SN)
86. how much love there is in **your** life (SN, KN, RS, SM)
87. the quality of **your** romantic relationships, marriage, love life or sex life (SM, SN, AHC, KSS, DS, M3, R)
88. **your** ability to have and raise children (AHC, DCG, KSS, SN)
89. the quality of **your** family relationships (TJ, AHC, DS, M3, R, SSF)
90. the happiness of **your** family (BHKR, LU)
91. **your** sense of community, belonging, and connection with other people (SN, DS, LU, DE-Flourishing)
92. **you** having people around you who share your values, beliefs and interests (HRS)
93. **you** having people you can turn to in time of need (DE-Flourishing, HRS)
94. **you** not being lonely (ABS, DS, SM)
95. **you** feeling that you are understood (BHKS)

96. **your** opportunities to participate in ceremonies, cultural events, and celebrations that are meaningful to you (BHKS)
97. **your** freedom from being lied to, deceived, or betrayed (M(desire), HRS)
98. **your** freedom from emotional abuse or harassment (BHKS)
99. the absence of humiliation and embarrassment in **your** life (SN)
100. the absence of shame and guilt in **your** life (PANAS, DCG, SN)
101. **your** sense that everything happens for a reason (BHKS)
102. **your** sense of connection with the universe or the power behind the universe (TJ)
103. **you** being a good, moral person and living according to your personal values (DBD, DE-Flourishing, MS, RS, TJ)
104. **you** feeling that you are part of something bigger than yourself (SM, TJ)
105. **your** sense that you are standing up for what you believe in (BHKS)
106. **your** sense that you know what to do when you face choices in your life (BHKS)
107. **your** ability to “be in the moment” (HRS)
108. **your** ability to keep good perspective in your life (BHKS)
109. how high **your** income is compared to the income of other people around you (DS, TJ)
110. **your** power over other people (BHKS)
111. **your** social status (DCG, TJ, BHKR, M)
112. **you** having others remember **you** and your accomplishments long after your death (BD)
113. the happiness of **your** friends (MS, BHKR, LU)
114. the condition of animals, nature, and the environment in the **world** (SN, SSF, AHC)
115. the amount of love in the **world** (BHKS)
116. the well-being of the people in the **world** (LU, RS)
117. the extent to which **humanity** does things worthy of pride (BHKS)
118. the morality, ethics, and goodness of other people in your **nation** (BHKS)
119. the well-being of the people in your **nation** (LU, RS)
120. your **nation** being a just society (MS, SN, GBF)
121. the extent to which your **nation** does things worthy of pride (BHKS, BD)
122. the amount of freedom in **society** (G)
123. freedom of speech and **people’s** ability to take part in the political process and community life (SN, SSF, Q, DG, AHC, RW)
124. freedom of conscience and belief in your **nation** (SN, Q, RW)
125. equality of income in your **nation** (BC)
126. equality of opportunity in your **nation** (SN, Q, G, RW)
127. **society** helping the poor and others who struggle (BHKS)
128. **people** getting the rewards and punishments they deserve (BBM)
129. the amount of order and stability in **society** (BHKS, BD)
130. freedom from corruption, injustice, and abuse of power in your **nation** (G)
131. trust among the people in your **nation** (DS, R)
132. the total size of your **nation's** economy (GDP) (Obj)
133. the average income of people in your **nation** (GDP per capita) (Obj)
134. the rate of economic growth (GDP growth) over time in your **nation** (Obj)

135. how low the rate of unemployment is in your **nation** (Obj)

136. how low the rate of inflation is in your **nation's** economy (Obj)

(e) Aspects of Well-Being by Whom They Refer To

We distinguish between five types of aspects according to who is described as affected by the level of that aspect.

1. **You-aspects** are aspects of well-being that pertain to one's own well-being (e.g. "how satisfied you are with your life") as well as the well-being of those who are emotionally close (such as one's family), without reference to others outside one's close circle. These aspects may be affected by the personal decisions of individuals without affecting the entire society. Hence, they can differ between individuals living in the same society (e.g., while one is satisfied with one's life, others in one's nation could be dissatisfied with their lives), but they could also in principle increase or decrease for everyone simultaneously. We view aspects 1–108 in the master list in (d) above as *you*-aspects.
2. **You-only aspects** are similar to *you*-aspects, but they are inherently relative to others (e.g., "your social status"). Hence, while they may be affected by personal decisions, they also affect others due to the externalities (positive or negative) they necessarily inflict on others, and they cannot meaningfully increase or decrease for everyone simultaneously. We view aspects 109–113 in the master list in (d) above as *you-only*-aspects. We view the first four—relative income, power over other people, social status, and post-mortem fame—as mostly comparative, zero-sum aspects, which could not in themselves vary for the nation as a whole, except for their dimensions that are already mostly captured by other aspects. For example, we felt that the *you*-aspects 84 and 85—having the people around you think well of you and treat you with dignity and respect, and having a role to play in society—capture important dimensions of the non-zero-sum part of the idea of social status. As to the fifth *you-only*-aspect—the happiness of your friends—we view it as a positive externality that does not meaningfully add up in the context of our scenarios: increasing or decreasing everyone's friends' happiness is reasonably simplified as increasing or decreasing everyone's happiness.
3. **Public-aspects** are essentially "public good" aspects: they pertain to an entire society's well-being, such as the entire nation (e.g., "equality of opportunity in your nation"), or, when stated, the entire world (e.g., "the condition of animals, nature, and the environment in the world"). In contrast with *you*- and *you-only*-aspects, *public*-aspects cannot typically be affected by the personal decisions of individuals, but they may be affected through national policy. Moreover, *public*-aspects cannot differ between individuals living in the same society; their levels are the same for everyone, and they can only increase or decrease for everyone simultaneously. We view aspects 114–136 in the master list in (d) above as *public*-aspects.
4. **Everyone-aspects** are *you*-aspects applied simultaneously to all individuals in the nation. For example, the *you*-aspect "how satisfied you are with your life" is modified to become the *everyone*-aspect "how satisfied people are with their lives"; the legend in the SP survey instructions explains that by the word

“people” we refer to everyone in the nation (see III.B. in the main text, or WAIII.B below). Like *public*-aspects, *everyone*-aspects can be affected through policy and cannot typically be affected by the personal decisions of individuals; and like *public*-aspects, by construction they cannot differ between individuals in the same nation and can only increase or decrease for everyone simultaneously. The list of 108 *everyone*-aspects—a modified version of the 108 *you*-aspects from the list in (d) above—is provided in subsection (f) below.

5. **Others-aspects** are similar to *everyone*-aspects with one exception: as explained in the SP-survey instructions legend, the word “others” refers to others in the nation, excluding the respondent and the respondent’s emotionally-close circle. In other words, *others*-aspects are *you*-aspects applied simultaneously to all individuals in the nation excluding the respondent’s close circle. Hence, for example, the *you*-aspect “how satisfied you are with your life” becomes the *others*-aspect “how satisfied others are with their lives”; in principle, a *you*-aspect and the corresponding *others*-aspect together add up to the corresponding *everyone*-aspect: how satisfied *you and others* are with your lives = how satisfied *everyone* is with their lives. By including both *you*- and *others*-aspects in the same scenario, we could explore how respondents trade off, e.g., their life satisfaction with the life satisfaction of unfamiliar others in the nation. As noted, such scenarios are not analyzed in the present paper. For completeness, however, the list of 108 *others*-aspects—a modified version of the 108 *you*-aspects from the list in (d) above—is provided in subsection (g) below.

A note about everyone- and others-aspects. One might care about aspects of others’ lives for altruistic, ideological, or other reasons. We consider any ethical duty people feel to speak up for those who are unable to speak up for themselves, however, to be separate from the preferences regarding what is happening to other people. In our survey, we told people to assume that other people also had a vote on policy in an attempt to relieve them from any ethical need to speak up for those who cannot speak for themselves and thereby isolate the preferences about what is happening to others from the fairness notion that everyone should have a voice.

(f) Aspects 1–108 Modified to Apply to Everyone (*everyone*-aspects)

1. how satisfied **people** are with their lives
2. **people’s** ratings of their lives on a ladder where the lowest rung is “worst possible life for them” and the highest rung is “best possible life for them”
3. how close **people’s** lives are to being ideal
4. the overall well-being of **people** and their families
5. **people** feeling that things are going well for them
6. **people** getting the things they want out of life
7. the extent to which **people** feel the things they do in their lives are worthwhile
8. how fulfilling **people’s** lives are
9. how rewarding the activities in **people’s** lives are
10. **people** having a beautiful life story, or a life that is “like a work of art”
11. how full of beautiful memories **people’s** lives are
12. how grateful **people** feel for the things in their lives

13. how much **people** appreciate their lives
14. the absence of regret **people** feel about their lives
15. how desirable **people's** lives are
16. how glad **people** are to have the lives they have rather than different lives
17. the extent to which **people** "have a good life"
18. how much **people** like their lives
19. **people** feeling that they have been fortunate in their lives
20. **people's** sense of optimism about their future
21. **people** having many options and possibilities in their lives and the freedom to choose among them
22. **people's** sense that things are getting better and better
23. how happy **people** feel
24. how much of the time **people** feel happy
25. how often **people** smile or laugh
26. how much **people** enjoy their lives
27. the absence of sadness in **people's** lives
28. **people** not feeling depressed
29. the absence of anger in **people's** lives
30. the absence of frustration in **people's** lives
31. the absence of fear in **people's** lives
32. **people** not feeling anxious
33. the absence of stress in **people's** lives
34. the absence of worry in **people's** lives
35. the quality of **people's** sleep
36. **people's** physical safety and security
37. the amount of order and stability in **people's** lives
38. **people's** sense of security about life and the future in general
39. **people's** physical comfort
40. **people's** freedom from pain
41. how easy and free of annoyances **people's** lives are
42. how peaceful, calm, and harmonious **people's** lives are
43. how often **people** can feel relaxed instead of feeling their lives are hectic
44. **people** feeling that they have enough time and money for the things that are most important to them
45. **people's** financial security
46. **people's** material standard of living
47. **people's** ability to dream and pursue their dreams
48. **people's** ability to use their imaginations and be creative
49. **people** having many moments in their lives when they feel inspired
50. how much beauty **people** experience in their lives
51. the amount of pleasure in **people's** lives
52. the amount of fun and play in **people's** lives
53. **people** having new things, adventure, and excitement in their lives
54. **people's** sense of discovery and wonder

55. **people** feeling that they understand the world and the things going on around them
56. **people's** knowledge, skills, and access to information
57. how often **people** are able to challenge their minds in a productive or enjoyable way
58. how interesting, fascinating, and free of boredom **people's** lives are
59. **people's** ability to be themselves and express themselves
60. **people's** personal growth
61. **people** "being the people they want to be"
62. **people's** ability to fulfill their potential
63. **people's** sense of purpose
64. **people** feeling that their lives have direction
65. **people's** sense of control over their lives
66. **people's** sense that their lives are meaningful and have value
67. **people's** sense that they are making a difference, actively contributing to the well-being of other people, and making the world a better place
68. the overall quality of **people's** experience at work
69. how often **people** become deeply engaged in their daily activities (so deeply engaged that they lose track of time)
70. **people's** feeling of independence and self-sufficiency
71. **people's** sense that they are competent and capable in the activities that matter to them
72. **people's** ability to shape and influence the things around them
73. **people's** sense of achievement and excellence
74. **people's** enjoyment of winning, competing, and facing challenges
75. **people's** success at accomplishing their goals
76. **people's** chances to live long lives
77. **people's** health
78. **people's** mental health and emotional stability
79. **people's** absence of internal conflict (conflict within a person)
80. **people's** ability to fully experience the entire range of healthy human emotions
81. **people** feeling alive and full of energy
82. **people's** passion and enthusiasm about things in their lives
83. **people's** pride and respect for themselves
84. **people** having the people around them think well of them and treat them with dignity and respect
85. **people** having a role to play in society
86. how much love there is in **people's** lives
87. the quality of **people's** romantic relationships, marriage, love life or sex life
88. **people's** ability to have and raise children
89. the quality of **people's** family relationships
90. the happiness of **people's** families
91. **people's** sense of community, belonging, and connection with other people
92. **people** having people around them who share their values, beliefs and interests
93. **people** having people they can turn to in time of need
94. **people** not being lonely

95. **people** feeling that they are understood
96. **people's** opportunities to participate in ceremonies, cultural events, and celebrations that are meaningful to them
97. **people's** freedom from being lied to, deceived, or betrayed
98. **people's** freedom from emotional abuse or harassment
99. the absence of humiliation and embarrassment in **people's** lives
100. the absence of shame and guilt in **people's** lives
101. **people's** sense that everything happens for a reason
102. **people's** sense of connection with the universe or the power behind the universe
103. **people** being good, moral people and living according to their personal values
104. **people** feeling that they are part of something bigger than themselves
105. **people's** sense that they are standing up for what they believe in
106. **people's** sense that they know what to do when they face choices in their lives
107. **people's** ability to "be in the moment"
108. **people's** ability to keep good perspective in their lives

(g) Aspects 1–108 Modified to Apply to Others (*others*-aspects)

1. how satisfied **others** are with their lives
2. **others'** ratings of their lives on a ladder where the lowest rung is "worst possible life for them" and the highest rung is "best possible life for them"
3. how close **others'** lives are to being ideal
4. the overall well-being of **others** and their families
5. **others** feeling that things are going well for them
6. **others** getting the things they want out of life
7. the extent to which **others** feel the things they do in their lives are worthwhile
8. how fulfilling **others'** lives are
9. how rewarding the activities in **others'** lives are
10. **others** having a beautiful life story, or a life that is "like a work of art"
11. how full of beautiful memories **others'** lives are
12. how grateful **others** feel for the things in their lives
13. how much **others** appreciate their lives
14. the absence of regret **others** feel about their lives
15. how desirable **others'** lives are
16. how glad **others** are to have the lives they have rather than different lives
17. the extent to which **others** "have a good life"
18. how much **others** like their lives
19. **others** feeling that they have been fortunate in their lives
20. **others'** sense of optimism about their future
21. **others** having many options and possibilities in their lives and the freedom to choose among them
22. **others'** sense that things are getting better and better
23. how happy **others** feel

24. how much of the time **others** feel happy
25. how often **others** smile or laugh
26. how much **others** enjoy their lives
27. the absence of sadness in **others'** lives
28. **others** not feeling depressed
29. the absence of anger in **others'** lives
30. the absence of frustration in **others'** lives
31. the absence of fear in **others'** lives
32. **others** not feeling anxious
33. the absence of stress in **others'** lives
34. the absence of worry in **others'** lives
35. the quality of **others'** sleep
36. **others'** physical safety and security
37. the amount of order and stability in **others'** lives
38. **others'** sense of security about life and the future in general
39. **others'** physical comfort
40. **others'** freedom from pain
41. how easy and free of annoyances **others'** lives are
42. how peaceful, calm, and harmonious **others'** lives are
43. how often **others** can feel relaxed instead of feeling their lives are hectic
44. **others** feeling that they have enough time and money for the things that are most important to them
45. **others'** financial security
46. **others'** material standard of living
47. **others'** ability to dream and pursue their dreams
48. **others'** ability to use their imaginations and be creative
49. **others** having many moments in their lives when they feel inspired
50. how much beauty **others** experience in their lives
51. the amount of pleasure in **others'** lives
52. the amount of fun and play in **others'** lives
53. **others** having new things, adventure, and excitement in their lives
54. **others'** sense of discovery and wonder
55. **others** feeling that they understand the world and the things going on around them
56. **others'** knowledge, skills, and access to information
57. how often **others** are able to challenge their minds in a productive or enjoyable way
58. how interesting, fascinating, and free of boredom **others'** lives are
59. **others'** ability to be themselves and express themselves
60. **others'** personal growth
61. **others** "being the people they want to be"
62. **others'** ability to fulfill their potential
63. **others'** sense of purpose
64. **others** feeling that their lives have direction
65. **others'** sense of control over their lives

66. **others'** sense that their lives are meaningful and have value
67. **others'** sense that they are making a difference, actively contributing to the well-being of other people, and making the world a better place
68. the overall quality of **others'** experience at work
69. how often **others** become deeply engaged in their daily activities (so deeply engaged that they lose track of time)
70. **others'** feeling of independence and self-sufficiency
71. **others'** sense that they are competent and capable in the activities that matter to them
72. **others'** ability to shape and influence the things around them
73. **others'** sense of achievement and excellence
74. **others'** enjoyment of winning, competing, and facing challenges
75. **others'** success at accomplishing their goals
76. **others'** chances to live long lives
77. **others'** health
78. **others'** mental health and emotional stability
79. **others'** absence of internal conflict (conflict within a person)
80. **others'** ability to fully experience the entire range of healthy human emotions
81. **others** feeling alive and full of energy
82. **others'** passion and enthusiasm about things in their lives
83. **others'** pride and respect for themselves
84. **others** having the people around them think well of them and treat them with dignity and respect
85. **others** having a role to play in society
86. how much love there is in **others'** lives
87. the quality of **others'** romantic relationships, marriage, love life or sex life
88. **others'** ability to have and raise children
89. the quality of **others'** family relationships
90. the happiness of **others'** families
91. **others'** sense of community, belonging, and connection with other people
92. **others** having people around them who share their values, beliefs and interests
93. **others** having people they can turn to in time of need
94. **others** not being lonely
95. **others** feeling that they are understood
96. **others'** opportunities to participate in ceremonies, cultural events, and celebrations that are meaningful to them
97. **others'** freedom from being lied to, deceived, or betrayed
98. **others'** freedom from emotional abuse or harassment
99. the absence of humiliation and embarrassment in **others'** lives
100. the absence of shame and guilt in **others'** lives
101. **others'** sense that everything happens for a reason
102. **others'** sense of connection with the universe or the power behind the universe
103. **others** being good, moral people and living according to their personal values
104. **others** feeling that they are part of something bigger than themselves

105. **others'** sense that they are standing up for what they believe in
106. **others'** sense that they know what to do when they face choices in their lives
107. **others'** ability to "be in the moment"
108. **others'** ability to keep good perspective in their lives

WAIII.B. Instructions Screen

On the following screens we will present you with a series of questions.

In each question, we will ask you to make a choice between two options. While some of the choices will relate to personal decisions that you face, others will relate to national policy questions that you and everyone else in your nation vote on.

The only information we will give you about the two options will be presented in a table similar to the example table below. The table compares the two options in terms of a few of their possible consequences over the next four years. For each possible consequence, the table indicates whether one option will rank higher than the other, and by how much.

Example table (related to a policy question):

	OPTION 1				about equal	OPTION 2		
	much higher	somewhat higher	slightly higher	slightly higher		somewhat higher	much higher	
your health			X					
others not feeling anxious						X		
how satisfied people are with their lives		X						
the amount of freedom in society					X			
...	(This is an example table. The actual table will have between two and six rows.)							

After showing you the table, we will ask you:

Between these two options, which do you think you would choose?

Please try to carefully study each table on the following screens, and answer every question the best you can.

(The items and their rankings in the tables are randomly chosen by the computer so that we learn as much as possible from your choices. We learn the most if you pay careful attention to all the items and their rankings when choosing.)

IMPORTANT: Notice that in each row of the table above, one word is emphasized in boldface type (e.g.: **your**, **others**, **people**, **society**). Please pay careful attention to the emphasized words, and interpret a consequence with the following emphasized words as affecting the following people:

you/your: affects only you (and, when stated, your family or close friends).

others/others': does not affect you, your family, or your friends—but does affect other people. The table indicates the average effect on other people in your nation.

nation/society/people: affects everyone in your nation (including you, your family, and your friends).

world/humanity: affects everyone in the world.

Aside from the differences indicated in the table, please assume that the two options rank *about equal* to each other in terms of **any possible consequences that are not mentioned in the table**. In other words, the two options are predicted to differ **only** on the things that are listed. For example, while the example table above indicates that Option 1 ranks slightly higher than Option 2 in terms of **your** health, you should assume that **others'** health is on average *about equal* across the two options.

When you are ready to start the survey, click "Next".

WAIV.A. Demographics from the Census

Detailed Citation for the Census Information in Table 1:

Variable	Detail
Marital Status	Table S1201: Marital Status, 2010 American Community Survey 1-Year Estimates. Calculated for the U.S. population 20 years and older. “Other” includes widowed, divorced, and separated.
Highest Education Level Completed	Table S1501: Educational Attainment, 2010 American Community Survey 1-Year Estimates. Calculated for the U.S. population 25 years and older.
Age	Table QT-P1: Age Groups and Sex: 2010, 2010 Census Summary File 1
Income	Table HINC-06. Income Distribution to \$250,000 or More for Households: 2010, Current Population Survey, 2011 Annual Social and Economic Supplement
Region	Table GCT-P2: Age Groups and Sex: 2010 - United States – Region, Division, and States; and Puerto Rico, 2010 Census Summary File 1. Calculated for population 18 years and older.

your power over other people	-0.09	0.022	108c			

Notes: Personal panel: OLS regression of stated preference on 113 personal aspects and a constant (const. = -0.02, s.e. = 0.004), using personal choice scenarios from surveys conducted after the programming bug that omitted some aspects was fixed ($N = 29,392$). The R^2 for this regression is 0.13. Correlation between these coefficients and those reported in table 2 is 0.99. Policy panel: OLS regression of stated preference on 131 policy aspects and a constant (const. = -0.01, s.e. = 0.005), using policy choice scenarios from surveys conducted after the programming bug was fixed ($N = 13,360$). The R^2 for this regression is 0.10. Correlation between these coefficients and those reported in table 2 is 0.97. In both panels, standard errors clustered at the respondent level. For the 108 aspects that have versions that appear in both types of scenarios, the text used in the personal choice scenarios is shown; in policy choice scenarios, “people” and “people’s” replace “you and “your.” For each scenario type, the numbers 1–108 are used to rank these aspects that appear in both scenario types by coefficient size. An aspect that appears in one scenario type receives a rank that places it appropriately in the ranking for that type (5a indicates that the coefficient was between the aspects ranked 5 and 6).

Notes: OLS regression of stated preference on dummies for gender and interactions of the dummies with 113 personal aspects, using personal choice scenarios ($N = 50,688$). The “Men” panel reports the coefficients, standard errors, and rank (within group) of the interactions of the aspects with the dummy equal to 1 if the subject is male. The other panel presents analogous results for women. The ratio is constructed by dividing each coefficient by the group mean coefficient and dividing the smaller standardized coefficient by the larger one. Standard errors clustered at the respondent level. The coefficients on the dummies are -0.02 (s.e. = 0.005) for the male dummy and -0.02 (s.e. = 0.004) for the female dummy. The R^2 for this regression is 0.13. Correlation between the coefficients for men and women is 0.91.

Notes: OLS regression of stated preference on dummies for gender and interactions of the dummies with 131 policy aspects, using policy choice scenarios ($N = 23,040$). The "Men" panel reports the coefficients, standard errors, and rank (within group) of the interactions of the aspects with the dummy equal to 1 if the subject is male. The other panel presents analogous results for women. The ratio is constructed by dividing each coefficient by the group mean coefficient and dividing the smaller standardized coefficient by the larger one. Standard errors clustered at the respondent level. The coefficients on the dummies are -0.02 (s.e. = 0.006) for the male dummy and -0.01 (s.e. = 0.006) for the female dummy. The R^2 for this regression is 0.11. Correlation between the coefficients for men and women is 0.73.

Notes: OLS regression of stated preference on dummies for income group and interactions of the dummies with 131 policy aspects, using policy choice scenarios ($N = 22,960$). The "Low Income" panel reports the coefficients, standard errors, and rank (within group) of the interactions of the aspects with the dummy equal to 1 if the subject has an income of less than \$50,000. The other panel presents analogous results for subjects with at least \$50,000 income. The ratio is constructed by dividing each coefficient by the group mean coefficient and dividing the smaller standardized coefficient by the larger one. Standard errors clustered at the respondent level. The coefficients on the low income and high income dummies are -0.02 (s.e. = 0.006) and -0.01 (s.e. = 0.006), respectively. The R^2 for this regression is 0.11. Correlation between the coefficients for the low income and high income groups is 0.80.

Notes: OLS regression of stated preference on dummies for social ideology and interactions of the dummies with 113 personal aspects, using personal choice scenarios ($N = 47,179$). The “Liberals” panel reports the coefficients, standard errors, and rank (within group) of the interactions of the aspects with the dummy equal to 1 if the subject responded that he was extremely liberal, liberal, or slightly liberal on social issues. The other panels present analogous results for the other groups. Conservatives thought of themselves as extremely conservative, conservative, or slightly conservative. Moderates responded that they were moderate or middle of the road. The ratio for each comparison is constructed by dividing each coefficient by the group mean coefficient and dividing the smaller standardized coefficient by the larger one. Standard errors clustered at the respondent level. The coefficients on the dummies are -0.03 (s.e. = 0.006) for the liberal dummy, -0.02 (s.e. = 0.006) for the moderate dummy, and -0.01 (s.e. = 0.005) for the conservative dummy. The R^2 for this regression is 0.14. Coefficient correlations are 0.88 for liberals and conservatives, 0.86 for liberals and moderates, and 0.91 for moderates and conservatives.

Notes: OLS regression of stated preference on dummies for social ideology and interactions of the dummies with 131 policy aspects, using policy choice scenarios ($N = 21,445$). The "Liberals" panel reports the coefficients, standard errors, and rank of the interactions of the aspects (within group) with the dummy equal to 1 if the subject responded that he was extremely liberal, liberal, or slightly liberal on social issues. The other panels present analogous results for the other groups. Conservatives thought of themselves as extremely conservative, conservative, or slightly conservative. Moderates responded that they were moderate or middle of the road. The ratio for each comparison is constructed by dividing each coefficient by the group mean coefficient and dividing the smaller standardized coefficient by the larger one. Standard errors clustered at the respondent level. The coefficients on the dummies are -0.02 (s.e. = 0.008) for the liberal dummy, -0.02 (s.e. = 0.008) for the moderate dummy, and -0.00 (s.e. = 0.007) for the conservative dummy. The R^2 for this regression is 0.12. Coefficient correlations are 0.60 for liberals and conservatives, 0.67 for liberals and moderates, and 0.70 for moderates and conservatives.

Notes: OLS regression of stated preference on dummies for religiosity and interactions of the dummies with 113 personal aspects, using personal choice scenarios ($N = 50,688$). The “More Religious” panel reports the coefficients, standard errors, and rank (within group) of the interactions of the aspects with the dummy equal to 1 if the subject attends religious services at least once per month. The other panel presents analogous results for subjects who attend religious services less often than once per month. The ratio is constructed by dividing each coefficient by the group mean coefficient and dividing the smaller standardized coefficient by the larger one. Standard errors clustered at the respondent level. The coefficients on the dummies are -0.02 (s.e. = 0.005) for the more religious dummy and -0.02 (s.e. = 0.004) for the less religious dummy. The R^2 for this regression is 0.13. Correlation between coefficients for the more religious and the less religious is 0.87.

Notes: OLS regression of stated preference on dummies for religiosity and interactions of the dummies with 131 policy aspects, using policy choice scenarios ($N = 23,040$). The "More Religious" panel reports the coefficients, standard errors, and rank (within group) of the interactions of the aspects with the dummy equal to 1 if the subject attends religious services at least once per month. The other panel presents analogous results for subjects who attend religious services less often. The ratio is constructed by dividing each coefficient by the group mean coefficient and dividing the smaller standardized coefficient by the larger one. Standard errors clustered at the respondent level. The coefficients on the more religious and less religious dummies are -0.01 (s.e. = 0.007) and -0.01 (s.e. = 0.005), respectively. The R^2 for this regression is 0.11. Correlation between coefficients for the more religious and the less religious is 0.81.

Notes: OLS regression of stated preference on dummies for two age groups and interactions of the dummies with 113 personal aspects, using personal choice scenarios ($N = 50,688$). The “Under Age 45” panel reports the coefficients, standard errors, and rank (within group) of the interactions of the aspects with the dummy equal to 1 if the subject is between the ages of 20 and 44. The other panel presents analogous results for subjects who are 45 years of age and older. The ratio is constructed by dividing each coefficient by the group mean coefficient and dividing the smaller standardized coefficient by the larger one. Standard errors clustered at the respondent level. The coefficients on the dummies are -0.03 (s.e. = 0.005) for the under 45 dummy and -0.01 (s.e. = 0.004) for the 45 and older dummy. The R^2 for this regression is 0.13. Correlation between the coefficients for younger and older respondents is 0.90.

Notes: OLS regression of stated preference on dummies for two age groups and interactions of the dummies with 131 policy aspects, using policy choice scenarios ($N = 23,040$). The "Under Age 45" panel reports the coefficients, standard errors, and rank (within group) of the interactions of the aspects with the dummy equal to 1 if the subject is between the ages of 20 and 44. The other panel presents analogous results for subjects who are 45 years of age and older. The ratio is constructed by dividing each coefficient by the group mean coefficient and dividing the smaller standardized coefficient by the larger one. Standard errors clustered at the respondent level. The coefficients on the dummies are -0.03 (s.e. = 0.006) for the under 45 dummy and -0.00 (s.e. = 0.006) for the 45 and older dummy. The R^2 for this regression is 0.11. Correlation between the coefficients for younger and older respondents is 0.75.

Notes: Personal panel: Estimates the model described in the main text section V.(i) via maximum likelihood, using the personal decision scenarios. The error term for the latent dependent variable, ε_s , is assumed to be normally distributed with mean 0 and variance σ^2 . Parameter estimates presented in the table are for β_i/σ . Sample: primary sample (see main text, $N = 50,688$). Estimates for $\gamma_{slightly}$ and $\gamma_{somewhat}$ are 0.754 (s.e. = 0.019) and 0.835 (s.e. = 0.019), respectively. The cutoffs for the latent variable are -1.107 (s.e. = 0.007), -0.444 (s.e. = 0.006), 0.031 (s.e. = 0.006), 0.501 (s.e. = 0.006), and 1.191 (s.e. = 0.007). Policy panel: results from the same model estimated using 131 aspects from the policy decision scenarios ($N = 23,040$). Estimates for $\gamma_{slightly}$ and $\gamma_{somewhat}$ are 0.804 (s.e. = 0.034) and 0.899 (s.e. = 0.035), respectively. The cutoffs for the latent variable are -1.185 (s.e. = 0.011), -0.507 (s.e. = 0.009), 0.024 (s.e. = 0.008), 0.532 (s.e. = 0.009), and 1.264 (s.e. = 0.011). Aspects in the table are ordered as in table 2. Correlations between these coefficients and those reported in table 2 is 1.00.

Notes: The “Linear” panel presents results of an OLS regression of stated preference on 113 personal aspects and a constant (const. = -0.06, s.e. = 0.011), using personal choice scenarios ($N = 50,688$). The scale is -3 to 3 for both choice and aspect ratings. Aspects are ordered in the table as in the main specification. Standard errors clustered at the respondent level. The R^2 for this regression is 0.12. The “Normalized” panel presents results of an OLS regression of normalized choice on 113 personal aspects and a constant (const. = -

0.10, s.e. = 0.020), using personal choice scenarios ($N = 50,457$). The dependent variable is constructed by dividing each subject's choice response on the -3 to +3 scale by the ratio of his standard deviation across all 30 scenarios (subjects with no variance were dropped) to the average standard deviation. The scale for aspect ratings is as in the main specification. Aspects are ordered in the table as in the main specification. Standard errors clustered at the respondent level. The R^2 for this regression is 0.10. Correlation between coefficients obtained using the linear scale and those in table 2 is 1.00. The correlation between coefficients obtained using the normalized scale and those in table 2 is 0.99.

Notes: The "Linear" panel presents results of an OLS regression of stated preference on 131 policy aspects and a constant (const. = -0.04, s.e. = 0.014), using policy choice scenarios ($N = 23,040$). The scale is -3 to 3 for both choice and aspect ratings. Aspects are ordered in the table as in the main specification. Standard errors clustered at the respondent level. The R^2 for this regression is 0.09. The "Normalized" panel presents results of an OLS regression of normalized choice on 131 policy aspects and a constant (const. = -0.08, s.e. = 0.022), using policy choice scenarios ($N = 22,935$). The dependent variable is constructed by dividing each subject's choice response on the -3 to +3 scale by the ratio of his standard deviation across all 30 scenarios (subjects with no variance were dropped) to the average standard deviation. The scale for aspect ratings is as in the main specification. Aspects are ordered in the table as in the main specification. Standard errors clustered at the respondent level. The R^2 for this regression is 0.08. Correlation between coefficients obtained using the linear scale and those in table 2 is 0.99. The correlation between coefficients obtained using the normalized scale and those in table 2 is 0.98.

Notes: Each of the two panels presents results of a model relating binary choice to the 113 personal aspects and a constant, using personal choice scenarios ($N = 50,688$). The constant is -0.05 (s.e. = 0.012) in the logit and -0.03 (s.e. = 0.007) in the probit. Aspects are ordered in the table as in the main specification. Standard errors clustered at the respondent level. The pseudo R^2 is 0.08 for both the logit and probit. Correlation between probit coefficients and those in table 2 is 0.99 . The correlation between logit coefficients and

those in table 2 is 0.99.

Notes: Each of the two panels presents results of models relating binary choice to the 131 policy aspects and a constant, using personal choice scenarios ($N = 23,040$). The constant is -0.04 (s.e. = 0.015) in the logit and -0.03 (s.e. = 0.009) in the probit. Aspects are ordered in the table as in the main specification. Standard errors clustered at the respondent level. The pseudo R^2 is 0.06 for both the logit and probit. Correlation between probit coefficients and those in table 2 is 0.97 . The correlation between logit coefficients and those in table 2 is 0.97 .

Notes: Personal panel: OLS regression of stated preference on the 94 personal aspects remaining after excluding scenarios with likely combination aspects and a constant (const. = -0.02, s.e. = 0.004), using personal choice scenarios ($N = 25,734$). The R^2 for this regression is 0.14. Correlation between these coefficients and those on these aspects in table 2 is 0.99. Policy panel: OLS regression of stated preference on the 112 policy aspects remaining after excluding scenarios with likely combination aspects and a constant (const. = -0.02, s.e. = 0.005) using the policy choice scenarios ($N = 17,287$). The R^2 for this regression is 0.11. Correlation between these coefficients and those on these aspects in table 2 is 0.99. In each regression, scenarios in which an aspect that is likely to be a combination aspect (one of the first 19 aspects) appeared are dropped. Standard errors clustered at the respondent level. For the 89 aspects that have versions that appear in both types of scenarios, the text used in the personal choice scenarios is shown; in policy choice scenarios, “people” and “people’s” replace “you and “your.” For each scenario type, the numbers 1–89 are used to rank these aspects that appear in both scenario types by coefficient size. An aspect that appears in one scenario type receives a rank that places it appropriately in the ranking for that type (5a indicates that the coefficient was between the aspects ranked 5 and 6).

Notes: No macro measures panel: OLS regression of stated preference on the 126 policy aspects not based on macro indicators and a constant (const. = -0.01, s.e. = 0.004), using policy choice scenarios ($N = 19,628$). The R^2 for this regression is 0.11. Correlation between these coefficients and those on these aspects in table 2 is 0.99. No macro measures or combination aspects panel: OLS regression of stated preference on the 107 non-combination, non-macro indicator policy aspects and a constant (const. = -0.01, s.e. = 0.005) using the policy choice scenarios ($N = 14,578$). The R^2 for this regression is 0.12. Correlation between these coefficients and those on these aspects in table 2 is 0.98. In each regression, scenarios in which the excluded aspects appeared are dropped. Standard errors clustered at the respondent level. For each specification, the numbers 1–107 are used to rank the non-summary aspects. A combination aspect, which may appear in the "no macro measures" specification only, receives a rank that places it appropriately in the ranking for that specification (5a indicates that the coefficient was between the non-combination aspects ranked 5 and 6).

how high your income is compared to the income of other people around you (dropped)						

Notes: OLS regression of stated preference on dummies for scenario length and interactions of the dummies with 113 personal aspects, using personal choice scenarios ($N = 50,688$). The “2 Aspects” panel reports the coefficients, standard errors, and rank of the interactions of the aspects with the dummy equal to 1 if the scenario contained 2 aspects. The other panels present analogous results

for the other scenario lengths. Standard errors clustered at the respondent level. The coefficients on the dummies are -0.03 (s.e. = 0.006) for the 2 aspects dummy, -0.01 (s.e. = 0.005) for the 3 aspects dummy, -0.02 (s.e. = 0.005) for the 4 aspects dummy, and -0.02 (s.e. = 0.005) for the 6 aspects dummy. The R^2 for this regression is 0.14. The interactions of one aspect with dummies for 4 and 6 aspects had to be dropped because each 4- and 6-aspect scenario was symmetric. Correlations of 2-aspect coefficients with 3-aspect, 4-aspect, and 6-aspect coefficients are 0.88, 0.92, and 0.86, respectively. Correlations of 3-aspect coefficients with 4-aspect and 6-aspect coefficients are 0.88 and 0.84, respectively. Correlation between 4-aspect coefficients and 6-aspect coefficients is 0.88.

the absence of shame and guilt in people's lives (dropped)						

Notes: OLS regression of stated preference on dummies for scenario length and interactions of the dummies with 131 policy aspects, using policy choice scenarios ($N = 23,040$). The "2 Aspects" panel reports the coefficients, standard errors, and rank of the interactions of the aspects with the dummy equal to 1 if the scenario contained 2 aspects. The other panels present analogous results for the other scenario lengths. Standard errors clustered at the respondent level. The coefficients on the dummies are -0.02 (s.e. = 0.008) for the 2 aspects dummy, -0.01 (s.e. = 0.008) for the 3 aspects dummy, -0.02 (s.e. = 0.007) for the 4 aspects dummy, and -0.02 (s.e. = 0.007) for the 6 aspects dummy. The R^2 for this regression is 0.12. The interactions of one aspect with dummies for 4 and 6 aspects had to be dropped because each 4- and 6-aspect scenario was symmetric. Correlations of 2-aspect coefficients with 3-aspect, 4-aspect, and 6-aspect coefficients are 0.64, 0.67, and 0.70, respectively. Correlations of 3-aspect coefficients with 4-aspect and 6-aspect coefficients are 0.52 and 0.54, respectively. Correlation between 4-aspect coefficients and 6-aspect coefficients is 0.60.

Notes to Figure WA1 (next page): Each graph plots the coefficient of each aspect estimated using scenarios of one length against the coefficient of that aspect estimated using scenarios of a different length. The coefficients are estimated from the model described in the notes to table WA12. Solid line: SD line; dashed line: 45-degree line. The SD line goes through the means and has a slope equal to the ratio of the standard deviations. The intercept of the SD line and the correlation between the sets of coefficients are reported on each graph.

Notes: OLS regression of stated preference on dummies for approximate timing sextiles and interactions of the dummies with 113 personal aspects, using personal choice scenarios ($N = 59,367$). The “under 8 minutes” panel reports the coefficients, standard errors, and rank of the interactions of the aspects with the dummy equal to 1 if the scenario was completed by a subject who took fewer than 8 minutes to complete the survey. The other panels present analogous results for the other sextiles. Aspects appear in the table in the order in which they are ranked in table 2. Standard errors clustered at the respondent level. The coefficients on the dummies are -0.08

(s.e. = 0.010) for the under 8 minutes dummy, -0.03 (s.e. = 0.008) for the 8-12 minutes dummy, -0.02 (s.e. = 0.007) for the 12-16 minutes dummy, -0.01 (s.e. = 0.007) for the 16-21 minutes dummy, -0.02 (s.e. = 0.007) for the 21-31 minutes dummy, and -0.02 (s.e. = 0.007) for the 31 minutes or more dummy.

Correlations between sets of coefficients

	8-12 mins	12-16 mins	16-21 mins	21-31 mins	31+ mins
under 8 mins	0.23	0.32	0.32	0.29	0.28
8-12 mins		0.80	0.81	0.76	0.79
12-16 mins			0.89	0.84	0.85
16-21 mins				0.86	0.86
21-31 mins					0.85

Notes: OLS regression of stated preference on dummies for approximate timing sextiles and interactions of the dummies with 131 policy aspects, using policy choice scenarios ($N = 26,985$). The "under 8 minutes" panel reports the coefficients, standard errors, and rank of the interactions of the aspects with the dummy equal to 1 if the scenario was completed by a subject who took fewer than 8 minutes to complete the survey. The other panels present analogous results for the other sextiles. Aspects appear in the table in the order in which they are ranked in the main specification for policy scenarios. Standard errors clustered at the respondent level. The coefficients on the dummies are -0.08 (s.e. = 0.011) for the under 8 minutes dummy, -0.03 (s.e. = 0.010) for the 8-12 minutes dummy, -0.02 (s.e. = 0.009) for the 12-16 minutes dummy, -0.01 (s.e. = 0.009) for the 16-21 minutes dummy, 0.01 (s.e. = 0.009) for the 21-31 minutes dummy, and -0.02 (s.e. = 0.009) for the 31 minutes or more dummy.

Notes: Personal panel: OLS regression of stated preference on 113 personal aspects and a constant (const. = -0.02, s.e. = 0.003), using personal choice scenarios. The R^2 for this regression is 0.18. Policy panel: OLS regression of stated preference on 131 policy aspects and a constant (const. = -0.01, s.e. = 0.005) using the policy choice scenarios. The R^2 for this regression is 0.15. In each regression, subjects who, when facing a scenario in which one option ranked higher in terms of all 3 aspects, chose the other option were excluded ($N = 39,226$ for personal, $N = 17,830$ for policy). Standard errors clustered at the respondent level. For the 108 aspects that have versions that appear in both types of scenarios, the text used in the personal choice scenarios is shown; in policy choice scenarios, “people” and “people’s” replace “you and “your.” For each scenario type, the numbers 1–108 are used to rank these aspects that appear in both scenario types by coefficient size. An aspect that appears in one scenario type receives a rank that places it appropriately in the ranking for that type (5a indicates that the coefficient was between the aspects ranked 5 and 6). Correlation between coefficients on personal aspects and those in table 2 is 0.99, and the correlation between coefficients on policy aspects and those in table 2 is 0.99.

Notes: Personal panel: OLS regression of stated preference on 113 personal aspects and a constant (const. = -0.02, s.e. = 0.003), using personal choice scenarios. The R^2 for this regression is 0.13. Policy panel: OLS regression of stated preference on 131 policy aspects and a constant (const. = -0.01, s.e. = 0.004) using the policy choice scenarios. The R^2 for this regression is 0.11. In each regression, subjects who said “not really” in response to the question that asked whether they understood what they were asked to do are excluded ($N = 47,190$ for personal, $N = 21,450$ for policy). Standard errors clustered at the respondent level. For the 108 aspects that have versions that appear in both types of scenarios, the text used in the personal choice scenarios is shown; in policy choice scenarios, “people” and “people’s” replace “you and “your.” For each scenario type, the numbers 1–108 are used to rank these aspects that appear in both scenario types by coefficient size. An aspect that appears in one scenario type receives a rank that places it appropriately in the ranking for that type (5a indicates that the coefficient was between the aspects ranked 5 and 6). Correlation between coefficients on personal aspects and those in table 2 is 0.999, and the correlation between coefficients on policy aspects and those in table 2 is 0.996.

Notes: OLS regression of stated preference on dummies for position in survey and interactions of the dummies with 113 personal aspects, using personal choice scenarios ($N = 50,688$). The “First 15 Scenarios” panel reports the coefficients, standard errors, and rank (within group) of the interactions of the aspects with the dummy equal to 1 if the appeared in the first half of the survey. The other panel presents analogous results for the scenarios that appeared in the second half. Standard errors clustered at the respondent level. The coefficients on the dummies are -0.02 (s.e. = 0.004) for the first 15 scenarios dummy and -0.02 (s.e. = 0.004) for the last 15 scenarios dummy. The R^2 for this regression is 0.13. Correlation between coefficients for early scenarios and coefficients for late scenarios is 0.94.

Notes: OLS regression of stated preference on dummies for position in survey and interactions of the dummies with 131 policy aspects, using policy choice scenarios ($N = 23,040$). The "First 15 Scenarios" panel reports the coefficients, standard errors, and rank (within group) of the interactions of the aspects with the dummy equal to 1 if the appeared in the first half of the survey. The other panel presents analogous results for the scenarios that appeared in the second half. Standard errors clustered at the respondent level. The coefficients on the dummies are -0.01 (s.e. = 0.006) for the first 15 scenarios dummy and -0.02 (s.e. = 0.006) for the last 15 scenarios dummy. The R^2 for this regression is 0.11. Correlation between coefficients for early scenarios and coefficients for late scenarios is 0.78.

WAVI.A Detecting Overlap in Survey Questions

Here we extend our theoretical framework to accommodate the possibility that individual survey questions may encompass more than one fundamental aspect, and survey questions might therefore overlap in content. Using this framework, we sketch an extension of our SP survey that could be used to test whether there is overlap between a given pair of survey questions. We emphasize that the purpose of this appendix is not to provide a complete analysis of overlap—an endeavor to which an entire paper could be devoted—but rather to demonstrate that methods based on stated preferences for detecting overlap can be developed, and to take some initial steps toward developing such methods. We note that it may be possible to prioritize which pairs of questions to test for overlap on the basis of researchers’ intuitions or respondents’ answers to direct probes asking about conceptual overlap. Our focus here, however, is on the test itself rather than on the prioritization process.

As mentioned in section VI.A of the main text, the overlap-detection method we propose proceeds in three steps. First, a set of SP-survey scenarios offers choices between a fixed, small increase in the first aspect in the pair being tested—say, life satisfaction—and various amounts of a small increase in a third aspect that serves as a numeraire. The amount of increase in the numeraire that makes the respondent indifferent is a measure of the utility gain from the increase in life satisfaction. Second, another set of SP-survey scenarios offers choices between a fixed, small increase in the second aspect in the pair—say, life worthwhileness—and various amounts of a small increase in the numeraire. The estimated numeraire indifference amount measures the utility gain from the increase in life worthwhileness. Third, a final set of SP-survey scenarios offers choices where one option is both the fixed increase in life satisfaction *and* the fixed increase in life worthwhileness, and the other option is various amounts of a small increase in the numeraire. These scenarios yield an estimate of the utility gain from the joint increase. We then compare the utility gain from the joint increase to the sum of the utility gains from the separate increases. Intuitively, if life satisfaction and life worthwhileness capture *non*-overlapping arguments of preferences, then since any smooth utility function is locally linear, the utility gain from the small joint increase in both arguments will be equal to the sum of utility gains from the small separate increases in each. In contrast, if the two questions assess overlapping arguments of preferences, then the utility gain from a small joint increase will be less than the sum of utility gains from the small separate increases because the overlapping part of the joint increase is taken into account by the survey respondent only once.

While this intuition may seem straightforward, it is less trivial than it appears. The subtlety is that a respondent could have different interpretations of what happens to the underlying fundamental aspects of well-being when told that two SWB questions separately increase than when told that they jointly increase.

This appendix develops a theoretical framework for analyzing respondents’ interpretations of SP-survey scenarios, and proposes two distinct sets of constraints on respondents’ interpretations under which this overlap-detection method is valid. Importantly, we note that some of these constraints can be made more likely to hold in practice by appropriately formulating the SP-survey instructions to encourage respondents to interpret the scenarios in accordance with the constraints. We emphasize, however, that while we believe that the constraints we propose are reasonable ones, we would advocate further analysis and, as much as possible, empirical testing

of the assumptions underlying these constraints before the overlap-detection method we describe is used in practice.

The remainder of this appendix is organized as follows. Subsection WAVI.A.i illustrates the overlap-detection method in the context of a specific example. Subsection WAVI.A.ii formally introduces the theoretical framework. Subsections WAVI.A.iii and WAVI.A.iv define the two different sets of constraints and demonstrate that, given either set of constraints, the overlap-detection method is justified. Proofs are relegated to subsection WAVI.A.v.

WAVI.A.i. Illustrative Example

The government wants to test whether conceptually-overlapping information is contained in an individual's responses to a proposed list of $N = 5$ SWB-survey questions:

(r_1) In general, how would you say your health is?

(r_2) Overall, how happy did you feel yesterday?

(r_3) Overall, how anxious did you feel yesterday? [reverse-coded so that higher responses mean less anxiety]

(r_4) Overall, how satisfied are you with your life nowadays?

(r_5) Overall, to what extent do you feel the things you do in your life are worthwhile?

(Question 1 is a standard self-reported overall health measure; this particular one is taken from the AGES-Reykjavik Study. Questions 2-5 are the four U.K. questions listed in the Introduction of the main text, here re-ordered.) While in reality the SWB survey would likely elicit each response r_n on a discrete scale (e.g., a number from 1-100 scale), for the purpose of the theory, we assume that the r_n 's are real numbers.

We distinguish between the responses to SWB survey questions (the r_n 's) and the respondent's levels of the fundamental aspects (the w_j 's) that the questions are intended to measure. To accommodate the possibility of overlap in the r_n 's, we need to generalize the theory from the main text by allowing the r_n 's to be functions of more than one fundamental aspect. In this example, suppose that there are $J = 3$ fundamental aspects—i.e., preferences are defined over 3 fundamental goods:

(w_1) health

(w_2) happiness

(w_3) lack of anxiety.

Each response to a SWB question is a function of the respondent's fundamental-aspect levels. We call this relationship the response's "production function." To illustrate, assume the following production functions:

$$\begin{aligned}
(1) \quad & r_1 = f_1(w_1) = w_1 \\
(2) \quad & r_2 = f_2(w_2) = w_2 \\
(3) \quad & r_3 = f_3(w_3) = w_3 \\
(4) \quad & r_4 = f_4(w_1, w_2) = \frac{1}{2}w_1 + \frac{1}{2}w_2 \\
(5) \quad & r_5 = f_5(w_2, w_3) = \frac{1}{2}w_2 + \frac{1}{2}w_3.
\end{aligned}$$

In this example, the production function f_2 means that the response r_2 elicited by the question “Overall, how happy did you feel yesterday?” is equal to the respondent’s current level of happiness, w_2 . The production function f_4 means that the response r_4 (to the life satisfaction question), it is equal to the average of the respondent’s levels of w_1 (health) and w_2 (happiness). In this subsection, the production functions are assumed to be linear. In the more general formulation in subsequent subsections, the functions will be assumed to be smooth and hence can be approximated as linear for small changes in the w_j ’s around current levels, $(\bar{w}_1, \bar{w}_2, \bar{w}_3)$. This linearity means that possible complementarities in the f_n ’s can be ignored in the analysis.

Since r_1 , r_2 , and r_3 each elicit exactly one fundamental aspect, we call them “fundamental responses,” while r_4 and r_5 are “combination responses.” Two responses “overlap” if their production functions depend on the same fundamental aspect. For example, r_4 and r_5 overlap because f_4 and f_5 both depend on w_2 . (For the same reason, they both also overlap with r_2 .) The researcher observes the responses, but not the fundamental-aspect levels. Furthermore, the production functions are unknown to the researcher; if they were known, it would be straightforward to identify pairs of SWB questions whose responses overlap, and an overlap-detection method would not be needed.

The respondent’s preferences depend on the levels of the fundamental aspects. For the example, we assume preferences can be represented by the utility function

$$(6) \quad u(w_1, w_2, w_3) = w_1 + w_2 + w_3.$$

Once again, in the more general formulation that follows, preferences will be assumed to be smooth, and linearity will be justified as an approximation that holds when the changes in the w_j ’s are small. The linear utility function means that possible complementarities in preferences can be ignored in the analysis.

Consider our method for detecting overlap, and the corresponding design of the SP survey, in the simplest case: testing for overlap between two responses that happen to be fundamental, r_2 and r_3 , and hence in fact do not overlap. In the first of the method’s three steps, a set of SP-survey scenarios asks the respondent to choose between a 1-unit gain in “happiness yesterday” (r_2) and varying amounts of a gain in a survey question that serves as a numeraire, say health (r_1). (In this example, the numeraire is a fundamental response (r_1), but we will show more generally that any response could be chosen as the numeraire.) This set of scenarios assesses the amount of gain in r_1 that would make the respondent indifferent to the 1-unit gain in r_2 . Given the utility

function in equation (6), this amount is 1 unit, and thus we will find that the relative marginal utility of r_2 is 1. The second step analogously assesses the relative marginal utility of r_3 with a set of scenarios where Option 1 is always a 1-unit gain in lack-of-anxiety (r_3), and Option 2 is varying amounts of a gain in r_1 . This relative marginal utility is also 1. In the third step, Option 1 is a 1-unit gain in r_2 and a 1-unit gain in r_3 , and as usual Option 2 is varying amounts of a gain in r_1 . The relative marginal utility of this joint increase is 2, which equals the sum of the relative marginal utilities of the separate increases.

The potential difficulties mentioned above arise when dealing with combination responses. The basic problem is that when one of the options in a SP survey specifies a given change in a combination response, there are many possible changes in the underlying fundamental aspects that could correspond to that specified change in the combination response. To analyze which of the possible fundamental-aspect changes is actually conceived by the respondent, we will define “interpretation functions.” They characterize the changes in fundamental aspects that a respondent envisions as a function of the changes in responses specified in the SP-survey option. These interpretation functions are unknown to the researcher.

To illustrate, consider testing for overlap between two combination responses that overlap, r_4 and r_5 . The first set of SP-survey scenarios asks the respondent to choose between a 1-unit gain in the response to the life satisfaction question (r_4) and varying amounts of a gain in the numeraire, health (r_1). Suppose the respondent interprets a 1-unit gain in life satisfaction as meaning that there is a 1-unit gain in each of its constituents, health (w_1) and happiness (w_2). Then we will find that the respondent is indifferent between a 1-unit gain in r_4 and a 2-unit gain in r_1 . The second set of SP-survey scenarios asks the respondent to choose between a 1-unit gain in the response to the life worthwhileness question (r_5) and varying amounts of a gain in health (r_1). Supposing the respondent interprets a 1-unit gain in life worthwhileness as meaning that there is a 1-unit gain in each of its constituents—happiness (w_2) and lack of anxiety (w_3)—then we will again find that the relative marginal utility is 2. In the third step, Option 1 is a 1-unit gain in r_4 and a 1-unit gain in r_5 , and as usual Option 2 is varying amounts of a gain in r_1 . Suppose that the respondent interprets Option 1 as meaning that there is a 1-unit gain in each of health (w_1), happiness (w_2), and lack of anxiety (w_3). While not the only possible interpretation, it may seem natural: it is consistent with r_4 and r_5 each having increased by 1 unit, and it matches the interpretation of what happens to w_2 under either of the separate increases in r_4 and r_5 . Given that interpretation, the relative marginal utility of the joint increase is 3, which is indeed less than the sum of the relative marginal utilities of the separate increases.

Of course, this example made specific assumptions about how the respondent interprets the changes in the combination responses. In the remainder of this appendix, we will provide a more general framework for analyzing SP-survey responses. Rather than assuming particular interpretations, we show that our proposed overlap-detection method works under a wide range of possible interpretation functions, as long as they satisfy certain plausible constraints. There are interpretation functions satisfying each of the two sets of constraints that we will analyze that in fact will generate the interpretations that we simply assumed in the above example.

WAVI.A.ii. Theoretical Framework

We assume that a respondent's preferences can be represented by a continuously-differentiable utility function, $u(w_1, \dots, w_J)$, that is a monotonically increasing function of each of J fundamental aspects. Without loss of generality, here we orient the w_j 's so that higher levels are more preferred (e.g., "lack of anxiety" rather than "anxiety" is the fundamental aspect).

While the government cannot directly elicit the w_j 's, the government can elicit responses to a set of N SWB-survey questions, r_1, \dots, r_N . Each such response r_n is a continuously-differentiable and strictly increasing function f_n of a subset of the fundamental aspects. We call f_n the **production function** for response r_n . Abusing notation, we write " $w_j \in r_n$ " to signify that w_j is an argument of f_n .

We suppose that the SWB survey elicits the respondent's level of each r_n on a quantitative scale (e.g., points on a 1-100 scale), and the SP survey asks the respondent about quantitative changes on the same scale (unlike the simplified SP survey that we used in the main text). If some f_n is a function of just a single fundamental aspect w_j , then the response r_n corresponds one to one with w_j ; any such r_n can thus be used as a measure of w_j on both the SWB and SP surveys. We call such a r_n a **fundamental response**. We call any r_n whose corresponding f_n depends on more than one fundamental aspect a **combination response**. The government does not observe which, or even how many, fundamental aspects each r_n depends on.

We say that r_n and $r_{n'}$ **overlap** if f_n and $f_{n'}$ share at least one fundamental aspect as an argument. We say that r_n and $r_{n'}$ **locally overlap** if there is some fundamental aspect w_j such that both $\frac{\partial f_n}{\partial w_j}$ and $\frac{\partial f_{n'}}{\partial w_j}$, evaluated at current fundamental-aspect levels, are non-zero. Because our overlap-detection method relies on SP-survey scenarios involving small changes from current fundamental-aspect levels, it is designed to detect local overlap. Local overlap is a sufficient condition for global overlap. Moreover, under our assumption that each f_n is a strictly increasing function, local overlap is also a necessary condition for global overlap.

Let $\bar{w}_1, \dots, \bar{w}_J$ denote the respondent's current levels of the fundamental aspects. The current responses to the SWB survey are therefore $(\bar{r}_1, \dots, \bar{r}_N)$, where each \bar{r}_n is equal to the value of f_n evaluated at the current levels of its fundamental-aspect arguments. We consider scenarios on a SP survey that give the respondent a choice between two options, each of which is a specific vector of responses (r_1, \dots, r_N) in a neighborhood of $(\bar{r}_1, \dots, \bar{r}_N)$. Equivalently, we will describe each option as a vector of changes relative to current levels, $(\Delta r_1, \dots, \Delta r_N)$. We use the term **option** to refer to such a specified vector of changes (which corresponds to the way we use the term "option" in the main text). We note that in a typical option, many of the Δr_n 's will equal zero.

In order to analyze the change in utility from specified Δr_n 's, we need to describe what the respondent envisions in terms of changes in the fundamental aspects as a function of these Δr_n 's. To do so, we define a family of **interpretation functions**, one for each subset of responses that could be specified as changing in an option. For example, for any option where Δr_4 is non-zero and the other Δr_n 's equal zero, the vector-valued function $I_4(\Delta r_4 | \bar{w}_1, \dots, \bar{w}_J) = (\Delta w_1, \dots, \Delta w_J)$ denotes the respondent's interpretation of what changes in the vector of fundamental aspects occurred as a function of the specified change in Δr_4 and of current fundamental-aspect levels. Similarly, for any option where Δr_5 is non-zero and the other Δr_n 's equal zero, the function $I_5(\Delta r_5 | \bar{w}_1, \dots, \bar{w}_J) = (\Delta w_1, \dots, \Delta w_J)$ describes the respondent's interpretation in terms of fundamental-aspect

changes. For any option where *both* Δr_4 and Δr_5 are non-zero but all other Δr_n 's are zero, the respondent's interpretation is described by $I_{4,5}(\Delta r_4, \Delta r_5 | \bar{w}_1, \dots, \bar{w}_J) = (\Delta w_1, \dots, \Delta w_J)$.

Each interpretation function is continuously differentiable and approaches the value $\mathbf{0}$ in the limit in which all its Δr_n arguments approach 0. By defining separate interpretation functions depending on the subset of responses that is specified as changing, we allow for the possibility that the interpretation of a change in a given response may depend on which other responses are also specified as changing (e.g., the interpretation of a change in life satisfaction can depend on whether life worthwhileness also changes). In particular, we do not assume that a respondent's interpretation is continuous when a response switches from being unchanged in an option to being specified as changed; for example, $I_4(\Delta r_4 | \bar{w}_1, \dots, \bar{w}_J)$ is not required to be equal to $\lim_{\Delta r_5 \rightarrow 0} I_{4,5}(\Delta r_4, \Delta r_5 | \bar{w}_1, \dots, \bar{w}_J)$ (and such discontinuities occur in many of the examples below). Each interpretation function may also take the value \emptyset , meaning that the respondent was unable to interpret the option, which would occur if the constraints (discussed below) on the I function cannot all be satisfied given the specified option. To accommodate this possibility, we require the SP survey to allow the respondent to tell us "this choice option does not make sense." Because $(\bar{w}_1, \dots, \bar{w}_J)$ is fixed in the analysis that follows, we suppress $I(\cdot)$'s dependence on it for brevity. We denote by $I^{(j)}(\cdot)$ the j^{th} element of the respondent's interpretation, that is, the interpreted change in fundamental-aspect j .

Implicit in our formulation of the interpretation functions is an assumption that the interpretation depends only on changes in responses specified in the option being evaluated, and not also on changes specified in the other option. We consider that assumption to be reasonable, but it could be made more likely to hold by instructing respondents to consider the two options independently of each other.

As an example of specific interpretation functions, the following are consistent with the example in subsection WAVI.A.i (recall that in the example, $N = 5$ and $J = 3$):

$$(7) \quad I_4(\Delta r_4) = (\Delta r_4, \Delta r_4, 0)$$

$$(8) \quad I_5(\Delta r_5) = (0, \Delta r_5, \Delta r_5)$$

$$(9) \quad I_{4,5}(\Delta r_4, \Delta r_5) = (\Delta r_4, \max\{\Delta r_4, \Delta r_5\}, \Delta r_5).$$

The interpretation function (7) indeed implies, consistent with the example in subsection WAVI.A.i, that a 1-unit increase in Δr_4 generates a 1-unit increase in each of w_1 and w_2 . Similarly, interpretation function (8) implies that a 1-unit increase in Δr_5 generates a 1-unit increase in each of w_2 and w_3 . And according to (9), a joint 1-unit increase indeed implies a 1-unit increase in each of w_1 , w_2 , and w_3 .

We collect some basic assumptions regarding the interpretation functions that we believe are reasonable into the "same-sign constraint," which has three parts. First, a fundamental aspect is not envisioned to change unless it is an argument of at least one response that is specified as changing. Second, when only a single response is specified as changing, then all of its constituent fundamental aspects are envisioned to change at least a little in

the same direction. Third, when changes in each of two responses would have been interpreted as generating the same direction of change in a fundamental aspect, then a joint change is interpreted as generating a change in the same direction. While the first part, and perhaps also the third part, may be intuitive (and unobjectionable), the second part is more substantive.

To facilitate formalizing the same-sign constraint, define $N_j := \{n | \Delta r_n \neq 0 \text{ and } w_j \in r_n\}$ to be the set identifying the responses for which w_j is an argument in the production function that are specified as changing.

Same-sign constraint:

- (i) For every interpretation function, if N_j is empty, then the interpretation function's implied change in w_j is zero.
- (ii) If $w_j \in r_n$ and $\Delta r_n > 0$, then $I_n^{(j)}(\Delta r_n) > 0$. (Similarly when the inequalities are replaced by $<$ and $<$.)
- (iii) If $I_n^{(j)}(\Delta r_n)$ and $I_{n'}^{(j)}(\Delta r_{n'})$ are both ≥ 0 with at least one inequality strict, then $I_{n,n'}^{(j)}(\Delta r_n, \Delta r_{n'}) > 0$. (Similarly when the inequalities are replaced by \leq and $<$.)

To illustrate, suppose as in the example in subsection W.AVI.A.i that $r_4 = f_4(w_1, w_2)$ and $r_5 = f_5(w_2, w_3)$. The first part implies: $I_4^{(3)}(\Delta r_4) = 0$ and $I_5^{(1)}(\Delta r_5) = 0$. The second part implies: if $\Delta r_4 > 0$, then $I_4^{(1)}(\Delta r_4) > 0$ and $I_4^{(2)}(\Delta r_4) > 0$. These together with the third part imply: if $\Delta r_4 > 0$ and $\Delta r_5 < 0$, then $I_{4,5}^{(1)}(\Delta r_4, \Delta r_5) > 0$ and $I_{4,5}^{(3)}(\Delta r_4, \Delta r_5) < 0$ (but the sign of $I_{4,5}^{(2)}(\Delta r_4, \Delta r_5)$ is not constrained); alternatively, if $\Delta r_4 > 0$ and $\Delta r_5 > 0$, then $I_{4,5}^{(1)}(\Delta r_4, \Delta r_5) > 0$, $I_{4,5}^{(2)}(\Delta r_4, \Delta r_5) > 0$, and $I_{4,5}^{(3)}(\Delta r_4, \Delta r_5) > 0$.

We will focus on options where the Δr_n 's, and implied Δw_j 's, are small. Doing so allows us to use the following approximations, which hold in a neighborhood of $(\bar{w}_1, \bar{w}_2, \bar{w}_3)$:

$$\Delta u \approx \sum_{j=1}^J \frac{\partial u}{\partial w_j} \Delta w_j$$

$$\Delta w_j \approx \sum_{n \text{ s.t. } w_j \in r_n} \frac{\partial I^{(j)}(\cdot)}{\partial \Delta r_n} \Delta r_n \text{ for all } j$$

$$\Delta r_n \approx \sum_{j \text{ s.t. } w_j \in r_n} \frac{\partial f_n}{\partial w_j} \Delta w_j \text{ for all } n$$

Due to these functions being locally linear, we can ignore a variety of possible complementarities: in preferences, in the production functions, and in the interpretation functions. Any such non-linearities would confound the inferences that can be drawn from comparing the relative marginal utility of a joint increase with the sum of the relative marginal utilities of separate increases.

Our reliance on small changes also justifies the possible use of any response as a numeraire for the overlap-detection method. A commodity can be used as a numeraire if preferences are quasi-linear in that commodity, and due to the linear approximations, preferences are (approximately) quasi-linear in any response. To illustrate, suppose that $\mathbf{I}_4(\Delta r_4) = (\Delta r_4, \Delta r_4, 0)$ consistent with the example in subsection WAVI.A.i, and suppose that r_4 is used as the numeraire. For small Δr_4 's, utility is roughly linear in changes in the “commodity” ($w_1 + w_2$), and thus treating r_4 as the numeraire would be justifiable.

The same-sign constraint and changes being small are not by themselves sufficient to ensure that the overlap-detection method is valid; additional assumptions are needed. The two sets of assumptions outlined in the next two subsections (respectively) constitute alternative ways to complete the theoretical framework.

WAVI.A.iii. The composite-aspect approach

The first approach combines an assumption that the combination responses correspond to “composite aspects” with a constraint on the interpretation functions.

A response r_n corresponds to a **composite aspect** if there exists an alternative representation of preferences besides $u(\cdot)$, call it $v(\cdot)$, that is a function of r_n and of the fundamental aspects that are *not* arguments of f_n . For example, consider the set-up in subsection WAVI.A.i in which $J = 3$ and $N = 5$. If $r_4 = f_4(w_1, w_2)$ corresponds to a composite aspect, then there is a function $v(\cdot)$ such that $u(w_1, w_2, w_3) = v(r_4, w_3)$. In words, the fundamental aspects that comprise a composite aspect whose level is conveyed by r_4 matter for preferences only via f_4 . Indeed, with production functions (4) and (5) and preferences that can be represented by (6), r_4 corresponds to a composite aspect because the utility function can be re-expressed as $u = 2r_4 + w_3$, and r_5 corresponds to a composite aspect because the utility function can be re-expressed as $u = w_1 + 2r_5$. Intuitively, such “composite responses” are combination responses that could be viewed as subutility functions.

The additional constraint on the interpretation functions requires that the fundamental-aspect changes envisioned would actually produce (according to the production functions) the changes in responses specified in the option.

Consistency constraint: For every interpretation function and any Δr_n arguments of the interpretation function, the implied vector of Δw_j 's produces the Δr_n arguments of the interpretation function.

For example, for the interpretation function $\mathbf{I}_{4,5}(\Delta r_4, \Delta r_5) = (\Delta w_1, \Delta w_2, \Delta w_3)$, the consistency constraint implies that for every $(\Delta r_4, \Delta r_5)$, the resulting fundamental-aspect vector (w_1, w_2, w_3) must satisfy $\Delta r_4 = f_4(w_1, w_2) - f_4(\bar{w}_1, \bar{w}_2)$ and $\Delta r_5 = f_5(w_2, w_3) - f_5(\bar{w}_2, \bar{w}_3)$. Given the production functions (4) and (5), the interpretation functions (7) and (8) satisfy the consistency constraint, but interpretation function (9) does not: for example, $\mathbf{I}_{4,5}(1,2) = (1,2,2)$, but the change in r_4 produced by the implied changes in w_1 and w_2 is $1\frac{1}{2}$.

Note that the consistency constraint only requires that the envisioned fundamental-aspect changes be consistent with the responses that are explicitly specified in the option. It does *not* additionally require consistency with Δr_n 's that are not explicitly specified as changing in an option. If it were modified to have this additional requirement, then the modified constraint would mean that a respondent is unable to interpret an option that specifies only a change in a combination response, since a change in a combination response also implies a change in at least one fundamental response. For example, $I_4(\Delta r_4)$ would be un-interpretable because Δr_4 implies a non-zero change in Δr_1 or Δr_2 , but neither is specified as changing. Under this modified constraint, identifying combination responses would be easy: respondents could be asked a series of SP-survey scenarios where each option specifies a change in exactly one of the responses. If the option specified a change in a fundamental response, then the respondent would be able to interpret the option, while if the option specified a change in a combination response, then the respondent would report that “this choice option does not make sense.” We believe that respondents in fact would not have difficulty interpreting options that specified a change only in a combination response, and therefore we believe the modified version of the consistency constraint is implausible.

Even with the (unmodified) consistency constraint as stated above, for some options the respondent's interpretation would be \emptyset . This would occur, for example, if two responses directly contradicted each other in what they imply for the change in some fundamental aspect. In such a case, there does not exist any interpretation function that would satisfy the consistency constraint.

A respondent would also have an interpretation of \emptyset if the consistency constraint and the same-sign constraint could not be satisfied simultaneously for the responses specified in a particular option. To understand this point, consider again the production functions (4) and (5). Although interpretation function (9) does not satisfy the consistency constraint, the following interpretation function both satisfies the consistency constraint and fits the example interpretation from subsection WAVI.A.i (i.e., it has the property that $I_{4,5}(1,1) = 1$):

$$(10) \quad I_{4,5}(\Delta r_4, \Delta r_5) = \left(\frac{3}{2} \Delta r_4 - \frac{1}{2} \Delta r_5, \frac{1}{2} \Delta r_4 + \frac{1}{2} \Delta r_5, \frac{3}{2} \Delta r_5 - \frac{1}{2} \Delta r_4 \right).$$

It may seem strange that an increase in r_4 is interpreted as *decreasing* w_3 , especially since w_3 is not even an argument of r_4 's production function. However, this feature of the interpretation function is necessitated by the consistency constraint! The reason is that an increase in r_4 implies an increase in w_2 , which taken by itself would produce an increase in r_5 ; in order to *not* affect r_5 , the increase in r_4 has to also decrease w_3 . Symmetrically, the increase in r_5 necessitates a decrease in w_1 in order to avoid affecting r_4 . However, the consistency constraint's implication that some of the implied w_j 's decrease when the r_n 's increase can clash with the same-sign constraint's requirement that these w_j 's increase. For example, the above interpretation (10) violates the same-sign constraint if Δr_4 and Δr_5 are both positive and $\frac{\Delta r_5}{\Delta r_4} > 3$. If a respondent had interpretation (10), then the respondent would envision the changes in fundamental aspects according to equation (10) as long as doing so satisfies the same-sign constraint, but the respondent's interpretation would be \emptyset if the same-sign constraint were violated.

The following proposition demonstrates that these assumptions are sufficient to justify the overlap-detection method.

Proposition 1: Suppose that combination responses correspond to composite aspects, and suppose that the interpretation functions satisfy the same-sign constraint and the consistency constraint. For small $\Delta r_n > 0$ and $\Delta r_{n'} > 0$ such that none of the relevant interpretations are \emptyset : if r_n and $r_{n'}$ do not locally overlap, then

$$\Delta u(\mathbf{I}_{n,n'}(\Delta r_n, \Delta r_{n'})) \approx \Delta u(\mathbf{I}_n(\Delta r_n)) + \Delta u(\mathbf{I}_{n'}(\Delta r_{n'}));$$

while if r_n and $r_{n'}$ locally overlap, then

$$\Delta u(\mathbf{I}_{n,n'}(\Delta r_n, \Delta r_{n'})) < \Delta u(\mathbf{I}_n(\Delta r_n)) + \Delta u(\mathbf{I}_{n'}(\Delta r_{n'})).$$

Figure WA2 illustrates the logic underlying the proposition using a Venn diagram. We suppose the production functions are given by equations (4) and (5), and preferences are represented by equation (6). The fundamental aspects w_1 , w_2 , and w_3 are drawn as having equal areas since their marginal utilities are equal (in general, the areas would be proportional to the marginal utilities). Due to the composite-aspect assumption, we can define re-scaled versions of the combination responses that are subutility functions of u : $\tilde{r}_4 = 2r_4$ and $\tilde{r}_5 = 2r_5$. These re-scaled composite aspects can be represented graphically as the union of the areas of the fundamental aspects they comprise. The same-sign constraint implies that a joint increase in r_4 and r_5 must involve an increase in all three fundamental aspects. The consistency constraint implies that a weighted average of the increases in w_1 and w_2 , with weights equal to their respective areas, must equal the specified increase in \tilde{r}_4 . Similarly, a weighted average of the increases in w_2 and w_3 , with weights equal to their respective areas, must equal the specified increase in \tilde{r}_5 . The net increase in utility is the area-weighted average of the increases in all three fundamental aspects. But since the increase in w_2 is shared, the gain in utility from the joint increase is smaller than the sum of the gains in utility from separate increases.

Figure WA2: Illustration for Proposition 1

Neither the composite-aspect assumption nor the consistency constraint without the other is sufficient for Proposition 1. To see the necessity of the composite-aspect assumption, continue to suppose that the production functions are given by equations (4) and (5), but now suppose that preferences can be represented by $u(w_1, w_2, w_3) = 4w_1 + w_2 + 4w_3$ so that r_4 and r_5 do not correspond to composite aspects. Suppose that the interpretation functions, which satisfy the consistency constraint, are given by $I_4(\Delta r_4) = \left(\frac{1}{2}\Delta r_4, \frac{3}{2}\Delta r_4, 0\right)$, $I_5(\Delta r_5) = \left(0, \frac{3}{2}\Delta r_5, \frac{1}{2}\Delta r_5\right)$, and $I_{4,5}(\Delta r_4, \Delta r_5) = \left(\frac{7}{4}\Delta r_4 - \frac{1}{4}\Delta r_5, \frac{1}{4}\Delta r_4 + \frac{1}{4}\Delta r_5, \frac{7}{4}\Delta r_5 - \frac{1}{4}\Delta r_4\right)$. The gain in utility from separate 1-unit increases in r_4 and r_5 are each $4\left(\frac{1}{2}\right) + 1\left(\frac{3}{2}\right) = 3\frac{1}{2}$, but the gain in utility from a joint 1-unit increase in both r_4 and r_5 is: $\left[\frac{7}{4}(4) - \frac{1}{4}(4)\right] + \left[\frac{1}{4}(1) + \frac{1}{4}(1)\right] + \left[\frac{7}{4}(4) - \frac{1}{4}(4)\right] = 12\frac{1}{2}$. It is *greater* than the sum of gains in utility from the separate increases. What went “wrong” here is that the joint increase in r_4 and r_5 is interpreted as involving greater increases in w_1 and w_3 than the separate increases would have, and w_1 and w_3 are particularly valuable fundamental aspects.

A simpler example shows that the composite-aspect assumption alone is not sufficient. Consider applying the overlap-detection method to non-overlapping responses, r_1 and r_2 . Suppose $I_1(\Delta r_1) = (\Delta r_1, 0, 0)$, $I_2(\Delta r_2) = (0, \Delta r_2, 0)$, and $I_{1,2}(\Delta r_1, \Delta r_2) = \left(\frac{1}{2}\Delta r_1, \Delta r_2, 0\right)$, meaning that a 1-unit increase in “how you would say your health is” is interpreted as a 1-unit increase in health when it appears alone in an option but as a $\frac{1}{2}$ -unit increase when it appears together with an increase in “how happy you felt yesterday.” In such a case, it would not be true that the joint marginal utility is equal to the sum of the separate marginal utilities. (If there were reason to be concerned about such an “interference effect,” respondents could be instructed to consider different rows in the aspect table independently if doing so is possible.)

We conclude this subsection by noting that if the combination responses correspond to composite aspects, then in accordance with what we note in footnote 30 of the main text, they could be substituted in the index for the fundamental responses corresponding with their underlying fundamental aspects.

WAVI.A.iv. The averaging-interpretation approach

The second approach—which does not require assuming that the combination responses correspond to composite aspects—does not impose the consistency constraint but instead imposes the “averaging constraint.” To facilitate formalizing this constraint, we refer to a function $A(x_1, \dots, x_n)$ as an n -argument **generalized averaging function** if it is continuous and satisfies $\min\{x_1, \dots, x_n\} \leq A(x_1, \dots, x_n) \leq \max\{x_1, \dots, x_n\}$ for all x_1, \dots, x_n .

Averaging constraint: For every interpretation function, if N_j is non-empty, then there exists an $|N_j|$ -argument generalized averaging function A such that the interpretation function’s implied change in w_j is

$$A\left(\left\{I_n^{(j)}(\Delta r_n)\right\}_{n \in N_j}\right).$$

The constraint states that, for any fundamental aspect, the interpretation of a joint change in responses is weakly in between the minimum and maximum change that would be implied by separate changes in the responses. The interpretation functions (7)-(9), which fit the example from subsection WAVI.A.i, satisfy the averaging constraint.

To give another example, suppose that the separate interpretations for r_4 and r_5 are:

$$(11) \quad I_4(\Delta r_4) = (\Delta r_4, \Delta r_4, 0)$$

$$(12) \quad I_5(\Delta r_5) = \left(0, \frac{3}{2}\Delta r_5, \frac{1}{2}\Delta r_5\right).$$

Each of the following interpretation functions for a joint increase would satisfy the averaging constraint:

$$I_{4,5}(\Delta r_4, \Delta r_5) = \left(\Delta r_4, \Delta r_4, \frac{1}{2}\Delta r_5\right)$$

$$I_{4,5}(\Delta r_4, \Delta r_5) = \left(\Delta r_4, \left(\frac{1}{4}\right)\Delta r_4 + \left(\frac{3}{4}\right)\frac{3}{2}\Delta r_5, \frac{1}{2}\Delta r_5\right)$$

$$I_{4,5}(\Delta r_4, \Delta r_5) = \left(\Delta r_4, \min\left\{\Delta r_4, \frac{3}{2}\Delta r_4\right\}, \frac{1}{2}\Delta r_5\right).$$

The value of Δw_3 must be $\frac{1}{2}\Delta r_5$ because r_5 is the only response specified as changing that relates to w_3 , and therefore nothing else is being averaged with the change in w_3 implied by a separate change in r_5 , namely $\frac{1}{2}\Delta r_5$. Similarly, the value of Δw_1 must be Δr_4 . For Δw_2 , each of the three interpretations corresponds to a different generalized-averaging function for a separate change in r_4 or r_5 : $A\left(\Delta r_4, \frac{3}{2}\Delta r_5\right) = \Delta r_4$, $A\left(\Delta r_4, \frac{3}{2}\Delta r_5\right) = \left(\frac{1}{4}\right)\Delta r_4 + \left(\frac{3}{4}\right)\frac{3}{2}\Delta r_5$, or $A\left(\Delta r_4, \frac{3}{2}\Delta r_5\right) = \min\left\{\Delta r_4, \frac{3}{2}\Delta r_4\right\}$.

Neither the averaging constraint nor the consistency constraint implies the other. For example, as noted above, given production functions (4) and (5), interpretation function (9) satisfies the averaging constraint but not the consistency constraint. While interpretation functions (7), (8), and (10) satisfy the consistency constraint, they violate the averaging constraint: $I_4^{(1)}(2) = 2$ and $I_5^{(1)}(1) = 0$, but $I_{4,5}^{(1)}(2,1) = 2\frac{1}{2}$, which is greater than both.

Note that if the consistency constraint is not imposed, then the production functions for the responses do not play a role in determining a respondent's interpretation of an option. In large part due to that fact, there exist families of interpretation functions that satisfy the same-sign constraint and the averaging constraint for *any* option, and therefore there is no reason for the interpretation to ever take the value \emptyset when only these constraints are imposed.

The SP-survey instructions could be written to discourage respondents from trying to satisfy the consistency constraint and encourage them to satisfy the averaging constraint. In particular, the instructions could state that the rows of the aspect table should not be understood as all being true, but rather as collectively describing the overall sense of the option, and with one row possibly overriding another. Alternatively or additionally, respondents could be explicitly instructed to envision the option as being the average of what is described across the rows of the aspect table. We emphasize here, as above, that survey instructions would need to be carefully formulated and empirically tested before being used in practice.

The following proposition establishes that the same-sign and averaging constraints taken together are sufficient for the overlap-detection method to be valid.

Proposition 2: Suppose that the interpretation functions satisfy the same-sign constraint and the averaging constraint. For small $\Delta r_n > 0$ and $\Delta r_{n'} > 0$: if r_n and $r_{n'}$ do not locally overlap, then

$$\Delta u(\mathbf{I}_{n,n'}(\Delta r_n, \Delta r_{n'})) \approx \Delta u(\mathbf{I}_n(\Delta r_n)) + \Delta u(\mathbf{I}_{n'}(\Delta r_{n'}));$$

while if r_n and $r_{n'}$ locally overlap, then

$$\Delta u(\mathbf{I}_{n,n'}(\Delta r_n, \Delta r_{n'})) < \Delta u(\mathbf{I}_n(\Delta r_n)) + \Delta u(\mathbf{I}_{n'}(\Delta r_{n'})).$$

The intuition underlying why the averaging constraint implies the last inequality is that, for each fundamental aspect that is envisioned to increase, the sum of the separate gains in utility due to the increase in that aspect is necessarily greater than the average of those gains. Consider a numerical example with interpretations (11), (12), and $\mathbf{I}_{4,5}(\Delta r_4, \Delta r_5) = (\Delta r_4, \min\{\Delta r_4, \frac{3}{2}\Delta r_4\}, \frac{1}{2}\Delta r_5)$, and with preferences represented by utility function (6). The gain in utility from a separate 1-unit increase in r_4 is $1(1) + 1(1) = 2$, and the gain from a separate 1-unit increase in r_5 is $\frac{3}{2}(1) + \frac{1}{2}(1) = 2$, so the sum is 4. The gain in utility from the joint 1-unit increase is $1(1) + 1(1) + \frac{1}{2}(1) = 2\frac{1}{2}$, which is smaller.

In this appendix, we have explored one SP-survey-based overlap-detection method, and we have explored two sets of constraints on respondents' interpretations that would justify it. There may well be other plausible constraints that respondents could be encouraged to satisfy that would also validate the method we have considered, and there may be other reasonable overlap-detection methods that are altogether distinct. These remain open questions for future research.

WAVI.A.v. Proofs

Proposition 1: Suppose that combination responses correspond to composite aspects, and suppose that the interpretation functions satisfy the same-sign constraint and the consistency constraint. For small $\Delta r_n > 0$ and $\Delta r_{n'} > 0$ such that none of the relevant interpretations are \emptyset : if r_n and $r_{n'}$ do not locally overlap, then

$$\Delta u(\mathbf{I}_{n,n'}(\Delta r_n, \Delta r_{n'})) \approx \Delta u(\mathbf{I}_n(\Delta r_n)) + \Delta u(\mathbf{I}_{n'}(\Delta r_{n'}));$$

while if r_n and $r_{n'}$ locally overlap, then

$$\Delta u(\mathbf{I}_{n,n'}(\Delta r_n, \Delta r_{n'})) < \Delta u(\mathbf{I}_n(\Delta r_n)) + \Delta u(\mathbf{I}_{n'}(\Delta r_{n'})).$$

Proof. We first focus on the right-hand side of both expressions in the proposition. The same-sign constraint implies that if $w_j \notin r_n$, then $I_n^{(j)}(\Delta r_n) = 0$. The consistency constraint implies that the changes in the fundamental aspects implied by $\mathbf{I}_n(\Delta r_n)$ in fact produce Δr_n . Local linearity, together with r_n being a composite response (i.e., a response corresponding to a composite aspect), implies that $\Delta u(\mathbf{I}_n(\Delta r_n)) \approx \frac{\partial v_n}{\partial r_n} \Delta r_n$, where $v_n(\cdot)$ is the alternative representation of $u(\cdot)$ that depends on r_n . Similarly, $\Delta u(\mathbf{I}_{n'}(\Delta r_{n'})) \approx \frac{\partial v_{n'}}{\partial r_{n'}} \Delta r_{n'}$, where $v_{n'}(\cdot)$ is the alternative representation of $u(\cdot)$ that depends on $r_{n'}$. Hence, $\Delta u(\mathbf{I}_n(\Delta r_n)) + \Delta u(\mathbf{I}_{n'}(\Delta r_{n'})) \approx \frac{\partial v_n}{\partial r_n} \Delta r_n + \frac{\partial v_{n'}}{\partial r_{n'}} \Delta r_{n'}$.

We now turn to the left-hand side of both expressions in the proposition. Local linearity implies that

$$\mathbf{I}_{n,n'}(\Delta r_n, \Delta r_{n'}) \approx \left(\frac{\partial I_{n,n'}^{(1)}(\Delta r_n, \Delta r_{n'})}{\partial \Delta r_n} \Delta r_n + \frac{\partial I_{n,n'}^{(1)}(\Delta r_n, \Delta r_{n'})}{\partial \Delta r_{n'}} \Delta r_{n'}, \dots, \frac{\partial I_{n,n'}^{(J)}(\Delta r_n, \Delta r_{n'})}{\partial \Delta r_n} \Delta r_n + \frac{\partial I_{n,n'}^{(J)}(\Delta r_n, \Delta r_{n'})}{\partial \Delta r_{n'}} \Delta r_{n'} \right).$$

Using local linearity again, $\Delta u(\mathbf{I}_{n,n'}(\Delta r_n, \Delta r_{n'})) \approx \sum_j \frac{\partial u}{\partial w_j} \left(\frac{\partial I_{n,n'}^{(j)}(\Delta r_n, \Delta r_{n'})}{\partial \Delta r_n} \Delta r_n + \frac{\partial I_{n,n'}^{(j)}(\Delta r_n, \Delta r_{n'})}{\partial \Delta r_{n'}} \Delta r_{n'} \right)$. We now

decompose the set of all fundamental aspects into those that are arguments of r_n , those that are arguments of $r_{n'}$, and those that are arguments of both (the same-sign constraint implies that no other fundamental aspects change):

$$\begin{aligned} \Delta u(\mathbf{I}_{n,n'}(\Delta r_n, \Delta r_{n'})) &\approx \sum_{j \text{ s.t. } w_j \in r_n} \frac{\partial u}{\partial w_j} \left(\frac{\partial I_{n,n'}^{(j)}(\Delta r_n, \Delta r_{n'})}{\partial \Delta r_n} \Delta r_n + \frac{\partial I_{n,n'}^{(j)}(\Delta r_n, \Delta r_{n'})}{\partial \Delta r_{n'}} \Delta r_{n'} \right) \\ &+ \sum_{j \text{ s.t. } w_j \in r_{n'}} \frac{\partial u}{\partial w_j} \left(\frac{\partial I_{n,n'}^{(j)}(\Delta r_n, \Delta r_{n'})}{\partial \Delta r_n} \Delta r_n + \frac{\partial I_{n,n'}^{(j)}(\Delta r_n, \Delta r_{n'})}{\partial \Delta r_{n'}} \Delta r_{n'} \right) \\ &- \sum_{j \text{ s.t. } w_j \in r_n, w_j \in r_{n'}} \frac{\partial u}{\partial w_j} \left(\frac{\partial I_{n,n'}^{(j)}(\Delta r_n, \Delta r_{n'})}{\partial \Delta r_n} \Delta r_n + \frac{\partial I_{n,n'}^{(j)}(\Delta r_n, \Delta r_{n'})}{\partial \Delta r_{n'}} \Delta r_{n'} \right). \end{aligned}$$

The consistency constraint implies that the first summation is the first-order effect on utility from Δr_n , which equals $\frac{\partial v_n}{\partial r_n} \Delta r_n$ due to the composite-aspect assumption. Similarly, the second summation is the first-order effect on utility from $\Delta r_{n'}$, which equals $\frac{\partial v_{n'}}{\partial r_{n'}} \Delta r_{n'}$. If r_n and $r_{n'}$ do not overlap, then the third summation is zero because the set of fundamental aspects over which the sum is taken is empty. If r_n and $r_{n'}$ overlap, then the set

is non-empty, and the same-sign constraint implies that the third summation is strictly positive. The result follows. \square

Proposition 2: Suppose that the interpretation functions satisfy the same-sign constraint and the averaging constraint. For small $\Delta r_n > 0$ and $\Delta r_{n'} > 0$: if r_n and $r_{n'}$ do not locally overlap, then

$$\Delta u(\mathbf{I}_{n,n'}(\Delta r_n, \Delta r_{n'})) \approx \Delta u(\mathbf{I}_n(\Delta r_n)) + \Delta u(\mathbf{I}_{n'}(\Delta r_{n'}));$$

while if r_n and $r_{n'}$ locally overlap, then

$$\Delta u(\mathbf{I}_{n,n'}(\Delta r_n, \Delta r_{n'})) < \Delta u(\mathbf{I}_n(\Delta r_n)) + \Delta u(\mathbf{I}_{n'}(\Delta r_{n'})).$$

Proof. We first focus on the right-hand side of both expressions in the proposition. The first part of the same-sign constraint implies that if $w_j \notin r_n$, then $\frac{\partial I_n^{(j)}(\Delta r_n)}{\partial \Delta r_n} = 0$. That fact, together with local linearity of $u(\cdot)$ and $I^{(j)}(\cdot)$, implies:

$$\begin{aligned} \Delta u(\mathbf{I}_n(\Delta r_n)) &\approx \sum_{j \text{ s.t. } w_j \in r_n} \frac{\partial u}{\partial w_j} \left(\frac{\partial I_n^{(j)}(\Delta r_n)}{\partial \Delta r_n} \Delta r_n \right) \\ \Delta u(\mathbf{I}_{n'}(\Delta r_{n'})) &\approx \sum_{j \text{ s.t. } w_j \in r_{n'}} \frac{\partial u}{\partial w_j} \left(\frac{\partial I_{n'}^{(j)}(\Delta r_{n'})}{\partial \Delta r_{n'}} \Delta r_{n'} \right). \end{aligned}$$

Adding these together and decomposing the set of all fundamental aspects into those that are arguments of r_n but not $r_{n'}$, those that are arguments of $r_{n'}$ but not r_n , and those that are arguments of both:

$$\begin{aligned} \Delta u(\mathbf{I}_n(\Delta r_n)) + \Delta u(\mathbf{I}_{n'}(\Delta r_{n'})) &\approx \sum_{j \text{ s.t. } w_j \in r_n, w_j \notin r_{n'}} \frac{\partial u}{\partial w_j} \left(\frac{\partial I_n^{(j)}(\Delta r_n)}{\partial \Delta r_n} \Delta r_n \right) \\ &+ \sum_{j \text{ s.t. } w_j \notin r_n, w_j \in r_{n'}} \frac{\partial u}{\partial w_j} \left(\frac{\partial I_{n'}^{(j)}(\Delta r_{n'})}{\partial \Delta r_{n'}} \Delta r_{n'} \right) \\ &+ \sum_{j \text{ s.t. } w_j \in r_n, w_j \in r_{n'}} \frac{\partial u}{\partial w_j} \left(I_n^{(j)}(\Delta r_n) + I_{n'}^{(j)}(\Delta r_{n'}) \right). \end{aligned}$$

We now turn to the left-hand side of both expressions in the proposition. The averaging constraint and the same-sign constraint together imply: for any j 's such that $w_j \notin r_n$ and $w_j \notin r_{n'}$, $I_{n,n'}^{(j)}(\Delta r_n, \Delta r_{n'}) \equiv 0$; for any j 's such that $w_j \in r_n$ and $w_j \notin r_{n'}$, $I_{n,n'}^{(j)}(\Delta r_n, \Delta r_{n'}) \equiv I_n^{(j)}(\Delta r_n)$; for any j 's such that $w_j \notin r_n$ and $w_j \in$

$r_{n'}, I_{n,n'}^{(j)}(\Delta r_n, \Delta r_{n'}) \equiv I_{n'}^{(j)}(\Delta r_{n'})$; and for any j 's such that $w_j \in r_n$ and $w_j \in r_{n'}, I_{n,n'}^{(j)}(\Delta r_n, \Delta r_{n'}) \equiv A\left(I_n^{(j)}(\Delta r_n), I_{n'}^{(j)}(\Delta r_{n'})\right)$. Hence

$$\begin{aligned} \Delta u\left(I_{n,n'}(\Delta r_n, \Delta r_{n'})\right) &\approx \sum_{j \text{ s.t. } w_j \in r_n, w_j \notin r_{n'}} \frac{\partial u}{\partial w_j} \left(\frac{\partial I_n^{(j)}(\Delta r_n)}{\partial \Delta r_n} \Delta r_n \right) \\ &+ \sum_{j \text{ s.t. } w_j \notin r_n, w_j \in r_{n'}} \frac{\partial u}{\partial w_j} \left(\frac{\partial I_{n'}^{(j)}(\Delta r_{n'})}{\partial \Delta r_{n'}} \Delta r_{n'} \right) \\ &+ \sum_{j \text{ s.t. } w_j \in r_n, w_j \in r_{n'}} \frac{\partial u}{\partial w_j} \left(A\left(I_n^{(j)}(\Delta r_n), I_{n'}^{(j)}(\Delta r_{n'})\right) \right). \end{aligned}$$

Thus, the right-hand side and the left-hand sides of the expressions in the proposition are approximately equal, except for the third summation. If r_n and $r_{n'}$ do not overlap, then the third summation is zero because the set of fundamental aspects over which the sum is taken is empty. If r_n and $r_{n'}$ do overlap, then the same-sign constraint implies that $I_n^{(j)}(\Delta r_n)$ and $I_{n'}^{(j)}(\Delta r_{n'})$ are strictly positive for all j , and therefore so are the third summations. Moreover, by definition of the generalized averaging function, $A\left(I_n^{(j)}(\Delta r_n), I_{n'}^{(j)}(\Delta r_{n'})\right) \leq \max\left\{I_n^{(j)}(\Delta r_n), I_{n'}^{(j)}(\Delta r_{n'})\right\} < I_n^{(j)}(\Delta r_n) + I_{n'}^{(j)}(\Delta r_{n'})$. The result follows. \square
