## For Online Publication

## Appendix A: Census Linkage

The detailed linkage procedure is as follows. This description is based heavily on the one provided by Collins and Zimran (2019).

1. We extracted males with non-empty first and last names from the full count 1850 and 1900 censuses and removed punctuation.
2. We divided the listed first name into a given name and middle initial, when one was present.
3. We replaced standard first name abbreviations (e.g., "Wm" was replaced with "William").
4. We removed any remaining spaces removed from the names.
5. After steps $1-4$, we linked the 1850 dataset to itself according to the following criteria. We then did the same for the 1900 dataset.
a. The birthplace (country or US state) matches exactly. ${ }^{49}$
b. The absolute difference in birth years is less than or equal to 4 .
c. The first three characters of last name soundex match, and either of the following two conditions are true:
i. The last name soundexes are identical and the SAS spelling distance (using the SAS function SPEDIS) is less than or equal to $20 .{ }^{50}$
ii. The last name soundexes are non-identical, and the SAS spelling distance is less than or equal to 17 .
d. First letter of first name matches, and spelling distance between first names is less than or equal to 20.
6. We removed from the sample any individual who had a candidate match in step 5 that was someone other than himself.
7. The remaining men from 1850 and 1900 and all those from 1880 and 1930 were cleaned according to steps 1,2 , and 4 above (no standardization of name abbreviations was made).
8. We linked males from 1850 to 1880 and from 1900 to 1930 according to the same criteria listed in step 5 , as well as the following additional criterion: where both records report a middle initial, the middle initials must match for a match to be made.
9. We dropped any case in which more than one 1880 individual matched to an 1850 individual or vice versa, and similarly for 1900 and 1930.
[^0]Table A.1: Linkage rates by birthplace, 1850-1880

|  | $(1)$ <br> Birthplace | Start | $(2)$ <br> Searched |
| :--- | :---: | ---: | ---: |
| Ireland | 303,507 | 80,457 | $(3)$ |
|  |  | $(0.265)$ | $(0.122)$ |
|  |  |  | $[0.032]$ |
| UK | 115,147 | 49,052 | 10,200 |
|  |  | $(0.426)$ | $(0.208)$ |
|  |  |  | $[0.089]$ |
| Germany | 177,189 | 105,711 | 13,300 |
|  |  | $(0.597)$ | $(0.126)$ |
|  |  |  | $[0.075]$ |
| Norway | 3,737 | 2,578 | 257 |

|  |  | $(0.775)$ | $(0.099)$ |
|  |  |  | $[0.076]$ |
| Austria | 110,233 | 89,470 | 6,141 |
|  |  | $(0.812)$ | $(0.069)$ |
| Germany | 536,944 | 257,337 | $[0.056]$ |
|  |  | $(0.479)$ | $(0.086$ |
| Poland | 141,175 | 114,140 | $[0.093]$ |
|  |  | $(0.809)$ | 10,388 |
|  | $(0.091)$ |  |  |
| Russia | 135,481 | 85,780 | $[0.074]$ |
|  |  | $(0.633)$ | $(0.0128$ |
|  |  |  | $[0.081]$ |

Notes: Numbers in parentheses indicate the fraction of the column that was advanced from the previous step. Numbers in square brackets indicate match rates relative to the base sample in column (1), which is from 1900. Sample limited to non-southern white men aged 18-40 in 1900.

Table A.3: Linkage rates by birthplace, 1900-1930, base year 1930

|  | $(1)$ | $(2)$ |
| :--- | :---: | ---: |
| Birthplace | Start | Linked |
| Norway | 76,827 | 8,798 |
|  |  | $(0.115)$ |
| Sweden | 141,860 | 8,933 |
|  |  | $(0.063)$ |
| United Kingdom | 192,377 | 28,733 |
|  |  | $(0.149)$ |
| Ireland | 157,338 | 10,785 |
|  |  | $(0.069)$ |
| France | 20,614 | 2,614 |
|  |  | $(0.127)$ |
| Netherlands | 22,103 | 4,515 |
|  |  | $(0.204)$ |
| Switzerland | 24,858 | 4,993 |
|  |  | $(0.201)$ |
| Italy | 152,955 | 14,416 |
|  |  | $(0.094)$ |
| Austria | 46,676 | 6,132 |
|  |  | $(0.131)$ |
| Germany | 378,230 | 50,082 |
| Poland |  | $(0.132)$ |
| Russia | 109,212 | 10,381 |
|  |  | $(0.095)$ |

Notes: Numbers in parentheses indicate link rates relative to column (1), which is the base sample from 1930. Sample limited to non-southern white men aged 44-74 in 1930, excluding unlinked immigrants arriving after 1900. Links to men not aged 18-40 in 1900 are not counted as links.

## Appendix B: Robustness Checks (For Online Publication)

Results excluding natives with immigrant fathers
Table B.1: Dissimilarity indices between natives and immigrants

|  | $(1)$ | $(2)$ | $(3)$ | $(4)$ |
| :---: | :---: | :---: | :---: | :---: |
|  | 1850 | 1880 | 1900 | 1930 |
| Dissimilarity | 0.3178 | 0.2164 | 0.1713 | 0.1321 |
|  | $(0.0038)$ | $(0.0039)$ | $(0.0033)$ | $(0.0029)$ |
| Observations | 227,358 | 227,358 | 477,665 | 477,665 |

Notes: Dissimilarity indices between natives' and immigrants' occupational distributions in each year, controlling for a quartic in age as described in equation (2). Robust delta method standard errors in parentheses. Observations weighted to correct for selection into linkage. Sample limited to individuals with occupations in both years.

| Weights |  |  |  |  | 1900 | 1850 |  |  |  |  |  |  |

Significance levels: ${ }^{a} \mathrm{p}<0.01,{ }^{b} \mathrm{p}<0.05,{ }^{c} \mathrm{p}<0.1$
Notes: Dependent variable is change in average occupational rank. Robust standard errors in parentheses. All specifications include a quartic in age and are weighted by inverse linkage probability. Excluded group in all specifications are natives. Weights indicate that the data are reweighted to match the occupational distribution of the year listed in the last row of the table, for immigrants and natives separately. Sample limited to individuals with occupations in both years.

## Appendix C: Additional Results (For Online Publication)

Figure C.1: Change in occupational rank by initial occupation and ethnicity
Figure C.1(a): 1850-1880

Figure C.1(b): 1900-1930

Notes: Each figure presents coefficients from regressing the change in the average occupational rank on ethnicity-initial occupational category indicators, with native-white collar as the excluded group and controlling for a quartic in age. Robust 95 percent confidence intervals reported. Observations weighted to correct for selection into linkage. Sample limited to individuals with occupations in both years.

Table C.1: Conditional changes in rank, by ethnicity

Notes: Robust standard errors in parentheses. Sample limited to individuals with occupations in both years. All specifications include a quartic in age and are weighted by inverse linkage probability, as described in text. Columns (1), (2), (4), and (5) present estimates of $\beta_{t}$ from equation (1) for each year with the listed variable on the left-hand side. Columns (3) and (6) present estimates of $\beta_{t}-$ $\beta_{t-30}$.

## Appendix D: Results Incorporating "Not Yet Classified" Occupations (For Online Publication)

The 1900 and 1930 complete-count datasets provided by Ruggles et al. (2019) are preliminary. The main complication that this induces for our analysis is that 10.87 percent of the 1900 sample and 16.47 percent of the 1930 sample have occupations categorized as "Not Yet Classified." To ensure that the exclusion of a sizable number of observations from our analysis as a result of this missing code is not responsible for our findings, this Appendix repeats our main results with imputed occupational codes for these unclassified individuals. Specifically, we assign these uncategorized individuals the modal occupational code assigned to all occupational strings with a matching NYSIIS code of the listed occupational string, in a manner similar to Collins and Wanamaker (2020). We continue to use the listed occupational code for cases that were assigned a code by Ruggles et al. (2019). Tables D.1-D. 3 show that our main results are qualitatively unaffected by including these individuals, implying that excluding these unclassified individuals does not drive our results.

Table D.1: Dissimilarity indices between natives and immigrants

|  | $(1)$ | $(2)$ | $(3)$ | $(4)$ |
| :--- | :---: | :---: | :---: | :---: |
|  | 1850 | 1880 | 1900 | 1930 |
| Dissimilarity | 0.3148 | 0.2133 | 0.1494 | 0.1264 |
|  | $(0.0037)$ | $(0.0039)$ | $(0.0023)$ | $(0.0024)$ |
| Observations | 237,203 | 237,203 | 860,247 | 860,247 |

Notes: Dissimilarity indices between natives' and immigrants' occupational distributions in each year, controlling for a quartic in age as described in equation (2). Robust delta method standard errors in parentheses. Observations weighted to correct for selection into linkage. Sample limited to individuals with occupations in both years.

Notes: Dependent variable is change in average occupational rank. Robust standard errors in parentheses. All specifications include a quartic in age and are weighted by inverse linkage probability. Excluded group in all specifications are natives. Weights indicate that the data are reweighted to match the occupational distribution of the year listed in the last row of the table, for immigrants and natives separately. Sample limited to individuals with occupations in both years.

## Appendix E: Results with Exact Matches Only (For Online Publication)

Abramitzky et al. (2019a) and Bailey et al. (2019) suggest that results be verified with link criteria of various strictness in order to ensure that false matches are not responsible for any results. To this end, we repeat our main results with what we call "exact" matches, whose quality suggests that they are less likely to be false positives. Specifically, these matches, in addition to meeting the criteria described in Appendix A, must also satisfy the following conditions:

1. The difference in age-implied birth years across the two censuses is not more than one year.
2. The first and last names across the two records are identical, except for the potential removal of double letters or the use of common name abbreviations.

Imposing this restriction and requiring that an individual have an occupation in both observed years and enough information with which to compute linkage weights (as in the main text) limits the sample to 107,704 natives linked from 1850-80, 7,644 immigrants linked from 1850-80, 323,182 natives linked from 1900-30, and 36,838 immigrants linked from 1900-30. These samples are considerably smaller than the main samples, and so some caution must be taken in interpreting the results. Nonetheless, this exercise provides an important check of our results.

We replicate the main results in Tables E.1-E.3. Naturally, eliminating a large fraction of the sample has an impact on the quantitative results. But the findings of unconditional assimilation in the nineteenth century and not in the twentieth, and the result that the difference is due to different initial occupation distributions are not qualitatively affected. We therefore conclude that false matches are unlikely to have qualitatively impacted our results.

Table E.1: Dissimilarity indices between natives and immigrants

Significance levels: ${ }^{a} \mathrm{p}<0.01,{ }^{b} \mathrm{p}<0.05,{ }^{c} \mathrm{p}<0.1$
Notes: Robust standard errors in parentheses. Sample limited to individuals with occupations in both years. All specifications include a quartic in age and are weighted by inverse linkage probability, as described in text. Columns (1), (2), (4), and (5) present estimates of $\beta_{t}$ from equation (1) for each year with the listed variable on the left-hand side. Columns (3) and (6) present estimates of $\beta_{t}$ -$\beta_{t-30}$.

Table E.3: Conditional changes in rank, exact matches only

|  | $(1)$ | $(2)$ | $(3)$ | $(4)$ | $(5)$ | $(6)$ |

Significance levels: ${ }^{a} \mathrm{p}<0.01,{ }^{b} \mathrm{p}<0.05,{ }^{c} \mathrm{p}<0.1$
Notes: Dependent variable is change in average occupational rank. Robust standard errors in parentheses. All specifications include a quartic in age and are weighted by inverse linkage probability. Excluded group in all specifications are natives. Weights indicate that the data are reweighted to match the occupational distribution of the year listed in the last row of the table, for immigrants and natives separately. Sample limited to individuals with occupations in both years.

## Appendix F: Results with Alternative Record Linkage Methods (For Online Publication)

We use two methods described and analyzed by Abramitzky et al. (2019a) to construct alternative linked samples with which to verify the robustness of our results. ${ }^{51}$ The first is the ABE linkage method based on NYSIIS standardization of names, and requiring uniqueness within a fiveyear band. The second is the ABE linkage method requiring exact matches by name, and requiring uniqueness within a five-year band. We do not use middle names in either of these matches. We refer to these two methods as "ABE-NYSIIS, 5-Year Band" and "ABE-Exact, 5 Year Band," respectively, in the following discussion.

Table F. 1 shows the match rates for natives and immigrants in a manner analogous to Table $1 .{ }^{52}$ Though there are differences between the match rates of Table 1 and those of Table F.1, the differences are not sizable. Table F. 2 compares the matches made by the various linkage methods. In Table F.2(a), we show that in the vast majority of cases in which our method and either of the ABE methods makes a match, the matches agree with one another. However, Table F.2(a) also shows that there was a large number of observations for which our method made a link and the ABE method did not or vice versa. These large non-overlapping sections of the linkage sets are to be expected given the differences in the link criteria used by each method-for instance, our method allows matches for individuals up to 4 years apart in age, whereas the ABE methods allow a match for a maximum difference of two years. We are reassured, however, by the fact that Table F.2(b) also shows that there are large non-overlapping sections between the two ABE linkage methods.

Tables F.3-F. 7 and Figure F. 1 repeat the main results of the paper with the two alternative linked samples. ${ }^{53}$ Given the strong similarity of results reached regardless of the linkage method, we conclude that our results are not spurious products of peculiarities of our linkage method.

[^1]Table F.1: Rates of successful linkage

|  | Natives |  |  |  |  | Immigrants |  |  |
| :--- | :---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
|  | (1) | $(2)$ | $(3)$ |  | $(4)$ | $(5)$ | $(6)$ |  |
| Link | Start | NYSIIS | Exact |  | Start | NYSIIS | Exact |  |
| $1850-1880$ | $2,064,491$ | 279,383 | 261,038 |  | 626,320 | 35,936 | 32,457 |  |
|  |  | $(0.135)$ | $(0.126)$ |  | $(0.057)$ | $(0.052)$ |  |  |
| $1900-1930$ (Base 1900) | $7,447,320$ | $1,051,037$ | $1,125,598$ |  | $2,235,798$ | 174,921 | 159,073 |  |
|  |  | $(0.141)$ | $(0.151)$ |  |  | $(0.078)$ | $(0.071)$ |  |
| $1900-1930$ (Base 1930) | $7,105,156$ | $1,071,513$ | $1,145,601$ |  | $1,650,691$ | 174,872 | 158,949 |  |
|  |  | $(0.151)$ | $(0.161)$ |  |  | $(0.106)$ | $(0.096)$ |  |

Notes: Numbers in parentheses indicate match rates relative to the full sample in columns (1) and (4). For 1850-1880, numbers are relative to the base year 1850. For 1900-1930, numbers are relative to the indicated base year. For 1850-1880 and 1900-1930 (Base 1900), the sample is limited to nonsouthern white men aged 18-40 in the base year. For 1900-1930 (Base 1930), the sample is limited to non-southern white men aged 44-74 in the base year excluding unlinked (by either method) immigrants arriving after 1900; in this case links to men not aged 18-40 in 1900 are not counted as links.

Table F.2: Comparison of matches made by the various linkage methods
Table F.2(a): Comparing our matching method to ABE

| Our Linkage | ABE-NYSIIS, 5 yr Band |  |  | ABE-Exact, 5 yr Band |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Matched |  | Unmatched(3) | Matched |  | Unmatched(6) |
|  | Agree <br> (1) | Disagree (2) |  | Agree <br> (4) | Disagree (5) |  |

Notes: For 1850 and 1880, the table includes white males linked from 1850 to 1880 who were ages 18-40 in 1850, who had an occupation in both years, and who did not live in the South in 1850. For 1900 and 1930, the table includes white males linked from 1900 to 1930 who were ages 18-40 in 1900, who had an occupation in both years, and who did not live in the South in either year.
Observation numbers are the minimum with data for all variables except literacy, old source, and years in US. Different observation numbers for the same cohort across years are due to occupations that could not be scored. Observations weighted to correct for selection into linkage. Standard deviations in parentheses.

Significance levels: ${ }^{a} \mathrm{p}<0.01,{ }^{b} \mathrm{p}<0.05,{ }^{c} \mathrm{p}<0.1$
Notes: Dependent variable is change in average occupational rank. Robust standard errors in parentheses. All specifications include a quartic in age and are weighted by inverse linkage probability. Excluded group in all specifications are natives. Sample limited to individuals with occupations in both years.

Figure F.1: Changes in occupational rank by initial occupation
Figure F.1(a): 1850-1880, ABE-NYSIIS 5 Year Band

Figure F.1(b): 1900-1930, ABE-NYSIIS 5 Year Band

Figure F.1(c): 1850-1880, ABE-Exact 5 Year Band

Figure F.1(d): 1900-1930, ABE-Exact 5 Year Band

Notes: Each figure presents coefficients from regressing the change in the average occupational rank on nativity-initial occupational category indicators, with native-white collar as the excluded group and controlling for a quartic in age. Robust 95 percent confidence intervals reported (but are so small that they do not exceed width of the point estimate markers). Observations weighted to correct for selection into linkage. Sample limited to individuals with occupations in both years.

[^0]:    ${ }^{49}$ For UK-born men (i.e., men born in England, Scotland, or Wales) in 1900-30, we require uniqueness within all UK-born men. In step 8, however, we require a match on the specific birthplace. This distinction is not made in 1850-80 because the data report only the UK as the country of birth.
    ${ }^{50}$ The SAS spelling distance is not a symmetric measure. Whenever we use spelling distance, we make a match when $\min \left\{\right.$ spedis $_{a, b}$, spedis $\left._{b, a}\right\} \leq c$, where $c$ is the linkage cutoff.

[^1]:    ${ }^{51}$ We executed these linkages using Stata code provided by Abramitzky et al. (2019a).
    ${ }^{52}$ The number in column (4) for the base-1930 data is different from Table 1 because individuals are included either if they are involved in a successful link or if their stated year of arrival is 1900 or earlier.
    ${ }^{53}$ Two individuals with extremely high real property values in 1850 ( $\$ 300,000$ or greater) were excluded from the analysis because their outlying wealth values resulted in inverse linkage probabilities that would cause these individuals to completely dominate any regression in which they were included.
